## Beta-Delayed Neutron Branching Ratios calculated by proton-neutron QRPA and statistical model

*Wednesday, December 11, 2024 4:35 PM (25 minutes)*

We recently carried out a systematic calculation for beta decay half-lives within proton-neutron QRPA. Our formalism adopted a Gogny type forces for both isospin  $T=0$  and  $T=1$  pairing channels.

This ensures us a reliable for beta-decay calculations within the QRPA. Delayed-neutron branching ratios are also estimated by a Hauser-Feshbach statistical model with beta-strength functions calculated by the QRPA.

We will discuss the results comparing with those of different models.
