Imaginary Time Mean-Field and Shell Model on Quantum Computers

Thursday, December 12, 2024 9:25 AM (25 minutes)

We present quantum algorithms for two approaches to nuclear structure: Firstly, the quantum imaginary time approach to state preparation which we use to produce solutions to nuclear density functional theory in the case of simplified Skyrme interactions: Secondly, a variational quantum eigensolver approach to the nuclear shell model, where we make use of particular physics-inspired ansatz choices to target ground and low-lying excited states in Ni-58. Simulated quantum calculations are presented, along with discussion of possible implementation on real hardware, and future perspectives on large-scale calculations.

Presenter: Prof. STEVENSON, Paul (University of Surrey)

Session Classification: Quantum Computing
