

Méril Reboud

[2013-2016] ÉNS de Lyon

[2016-2020] Ph.D. in Annecy with Diego Guadagnoli and Jean-Francois Marchand

[2020-2023] Postdoc #1 at TU Munich and IPPP Durham/IJClab

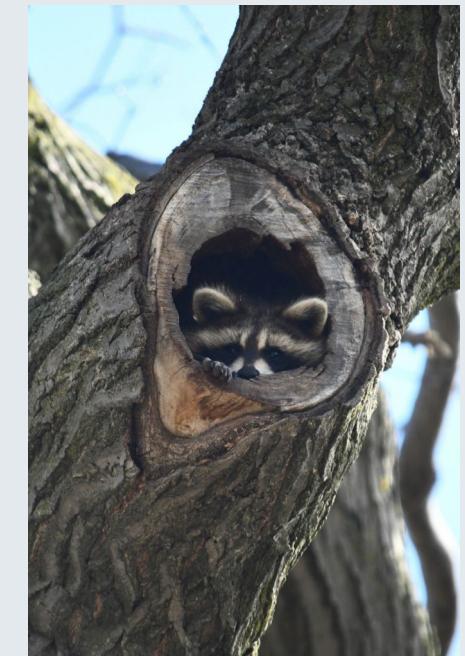

[2023-2024] Postdoc #2 in Siegen

Since 2024 Flavour group

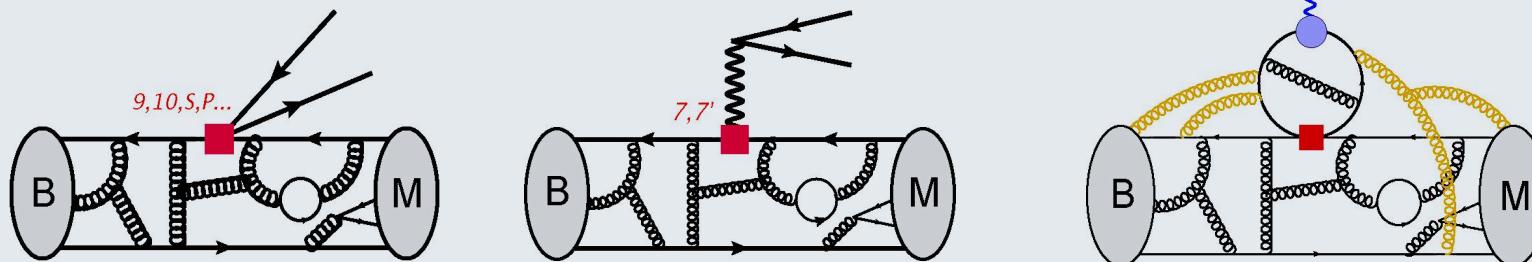

Hobbies

B physics phenomenology

- Improve theory prediction of B-physics observables in and beyond the SM

$$\mathcal{H}(b \rightarrow s\ell\ell) = -\frac{4G_F}{\sqrt{2}} V_{tb} V_{ts}^* \sum_{i=1}^{10} C_i(\mu) \mathcal{O}_i(\mu)$$

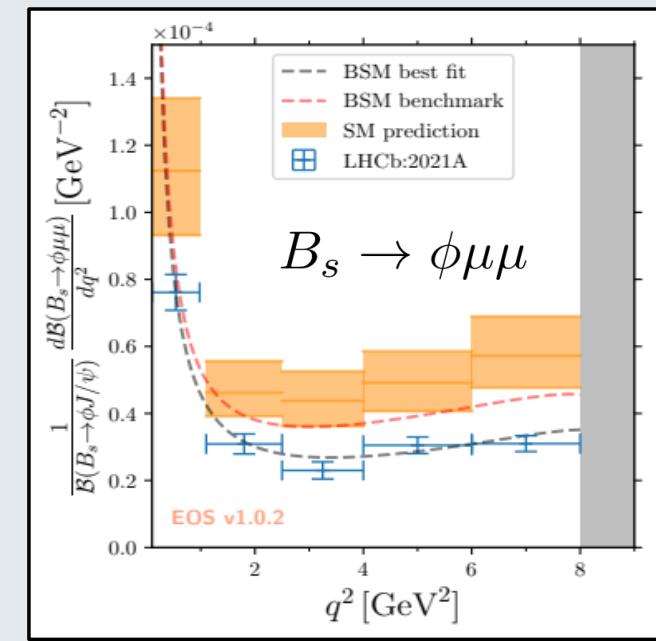

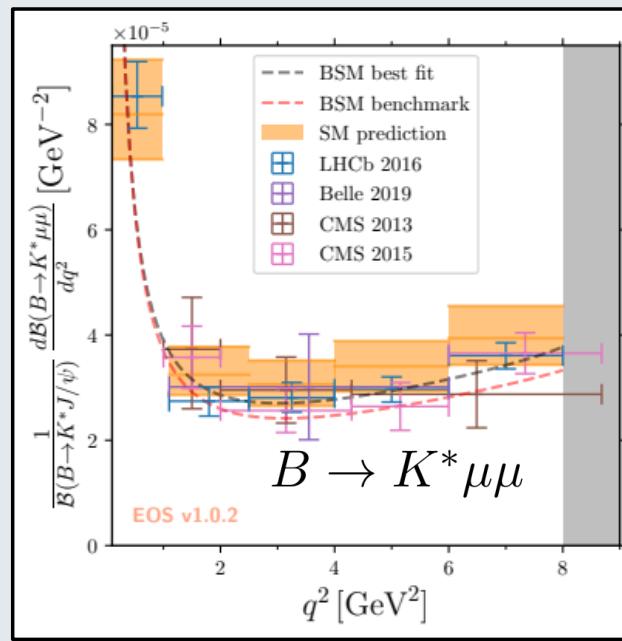

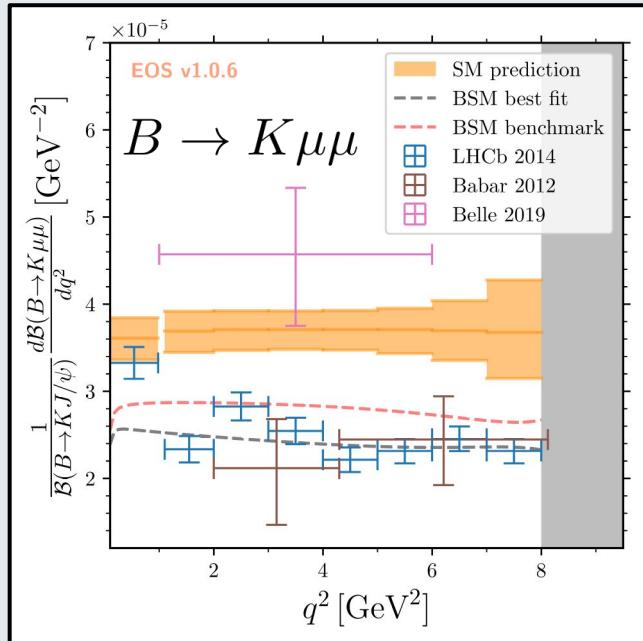

- Lattice
- QCD sum rules
- analyticity
- unitarity

Uncertainties??

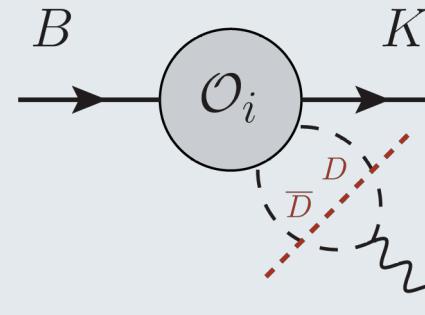

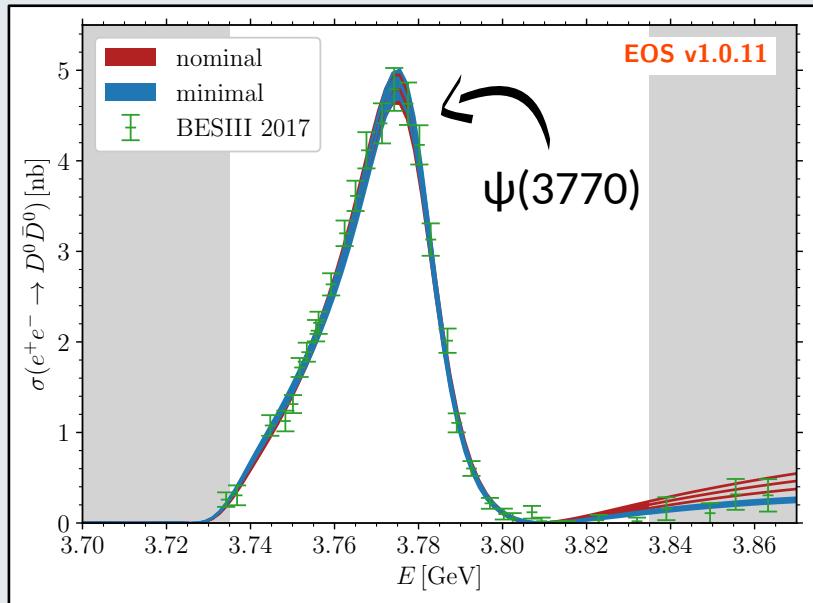

B physics phenomenology

- Improve theory prediction of B-physics observables in and beyond the SM

B physics phenomenology

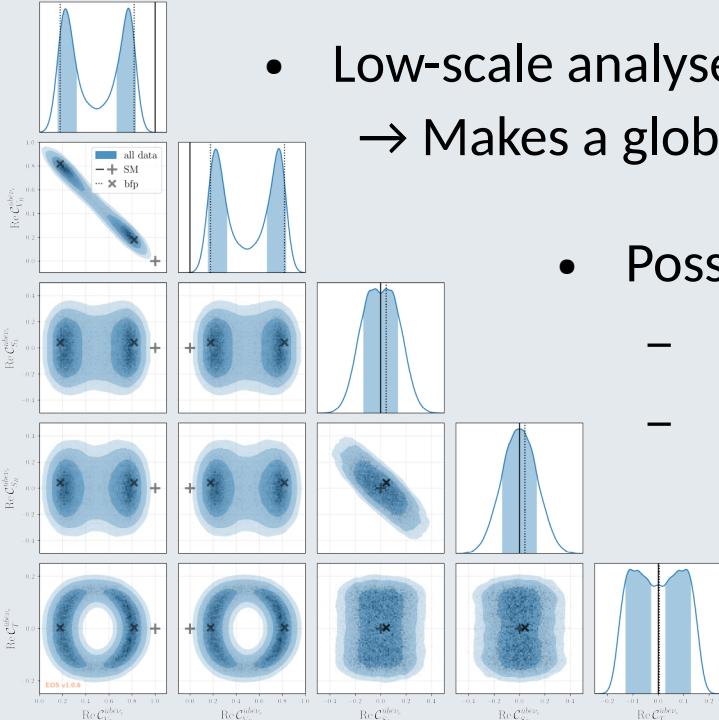

- Improve **theory prediction of B-physics** observables **in and beyond the SM**
- Extract **SM parameters** from combined fit of theoretical + experimental results

- Extract mass and couplings of the $c\bar{c}$ resonances in $e^+e^- \rightarrow D^{(*)}\bar{D}^{(*)}$ data using a K-Matrix approach
- Predict the $c\bar{c}$ component of $B \rightarrow K\ell\ell$

B physics phenomenology

- Improve **theory prediction of B-physics** observables **in and beyond the SM**
- Extract **BSM parameters** from combined fit of theoretical + experimental results

- Low-scale analyses deal with **O(100) independent nuisance parameters**
→ Makes a global test of new models *impossible in practice*
- Possible path forward:
 - Perform the fit **only once** within an EFT
 - Publish the **likelihood** of the Wilson coefficients

The EOS Software

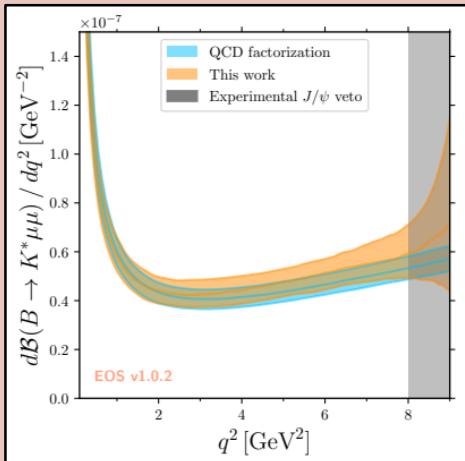

Theory inputs:

- Calculations
- Models

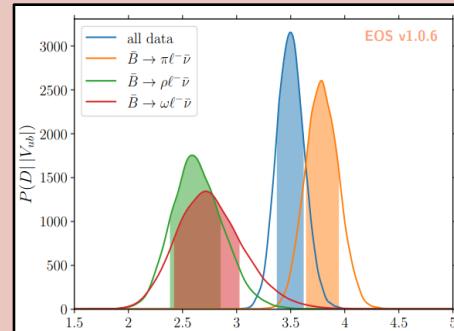

Experimental likelihoods:

- $b \rightarrow s, b \rightarrow c$
- charm physics...

Theory predictions:

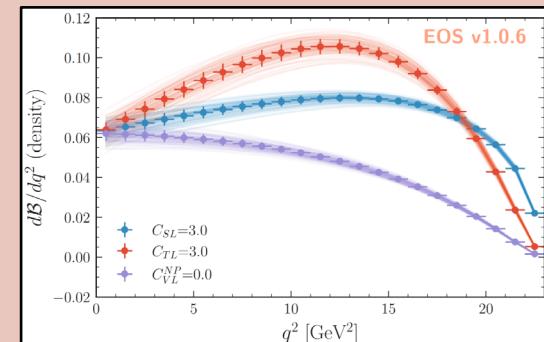

Parameter inference:

$$|V_{ub}| = (3.50^{+0.13}_{-0.12}) \times 10^{-3}$$

Monte-Carlo simulations:
