SiW ECAL Beam test

Yukun Shi, Xin Xia

On behalf of the SiW ECAL group

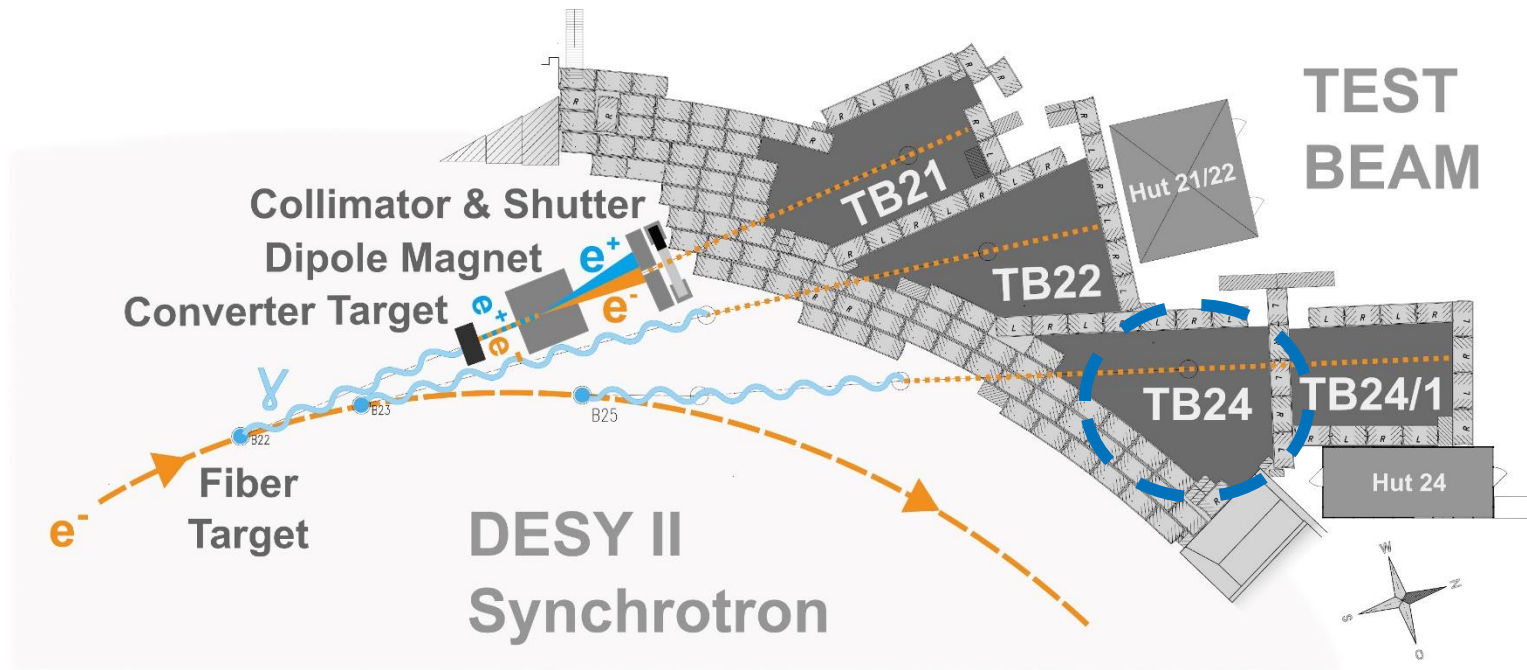

Out Line

- Background
- Commissioning
- Position Scan
- TDC
- Summary and outlook

Beam test Overview

T24

- Electron beam: MIP level test at 3 GeV
- Movable support: ~0.1mm precision

Desy Beam hall

Movable support

Testbeam 24 (e^- @ 6 GeV)

Energy vs rate for electron

Test setup

ECAL geometry

- 3 layers
 - 1 chip on board, 2 produced recently
 - 16 SKIROC ships
 - 32×32 cells: $5.5 \times 5.5 \text{ mm}^2$
 - No absorbers

Data Taking

- ECAL: Mar 4th - Mar 6th
 - Configuration and calibration
 - Position scan
 - a blown fuse identified and replaced
- ECAL+HCAL: Mar 7th - Mar 8th
 - Configuration and calibration
 - Position scan
- TDC test

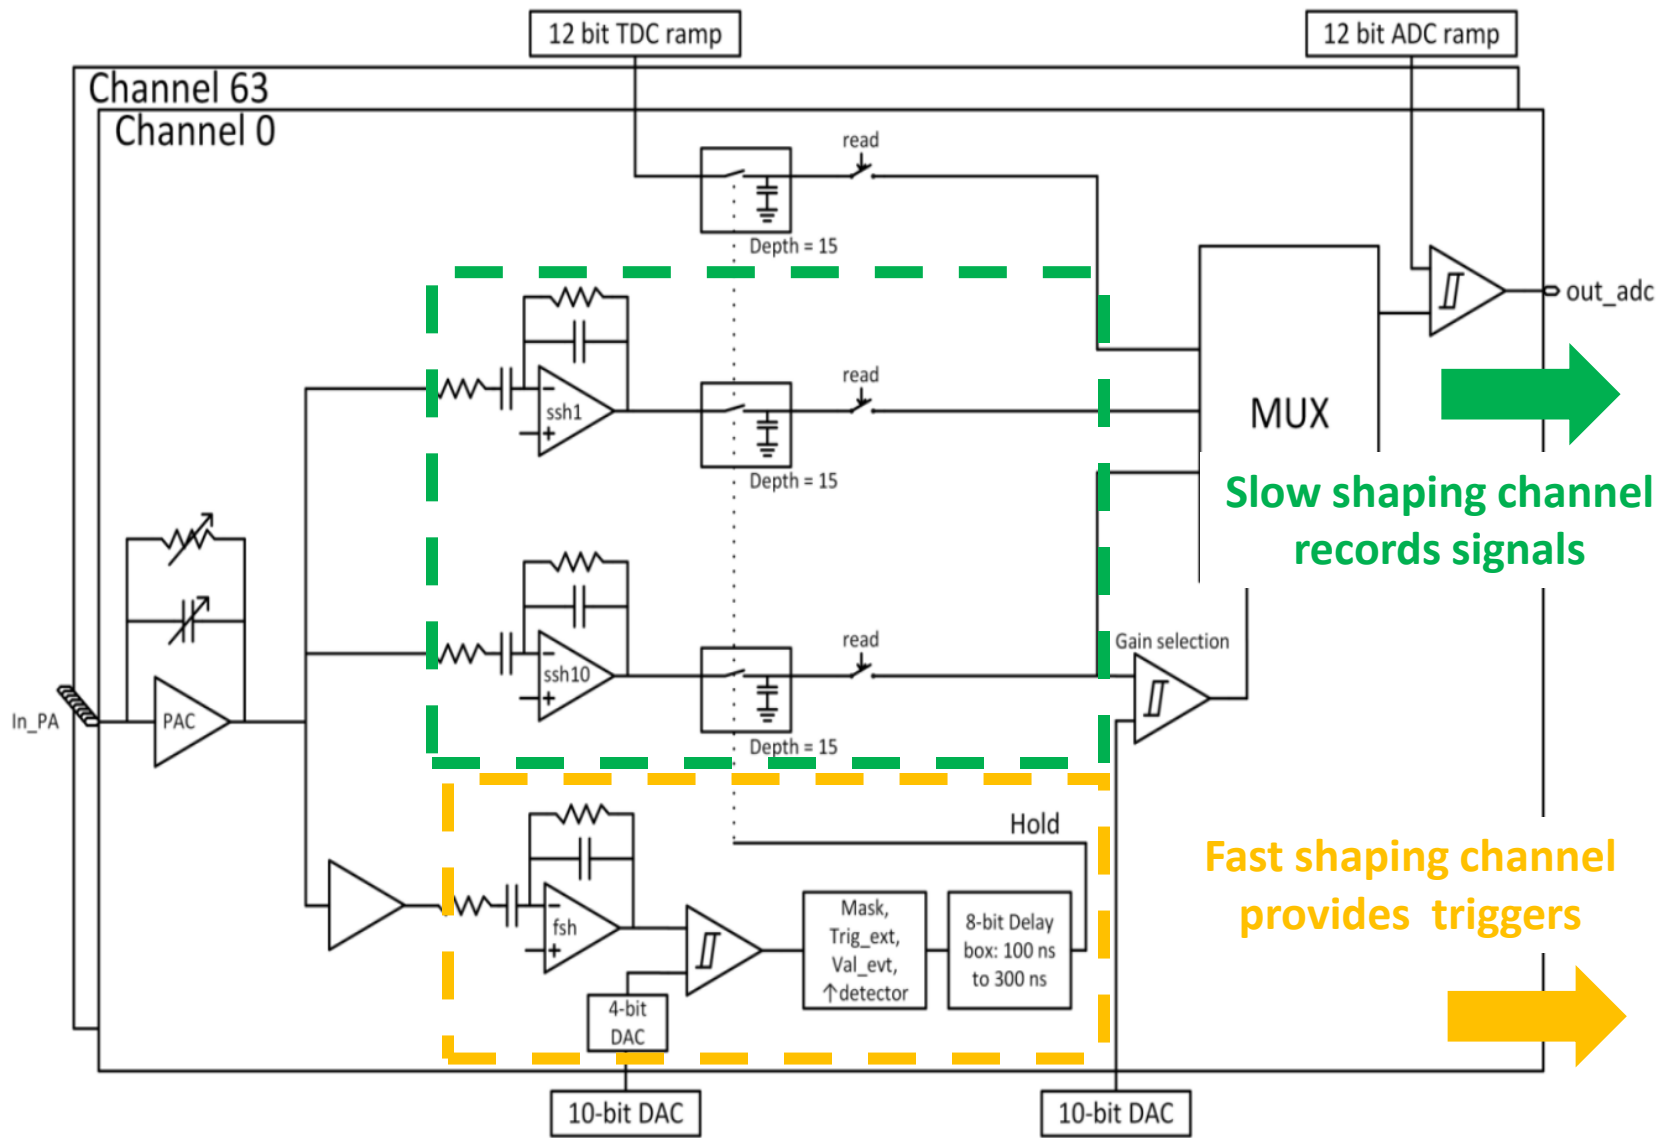

ECAL

ECAL+HCAL

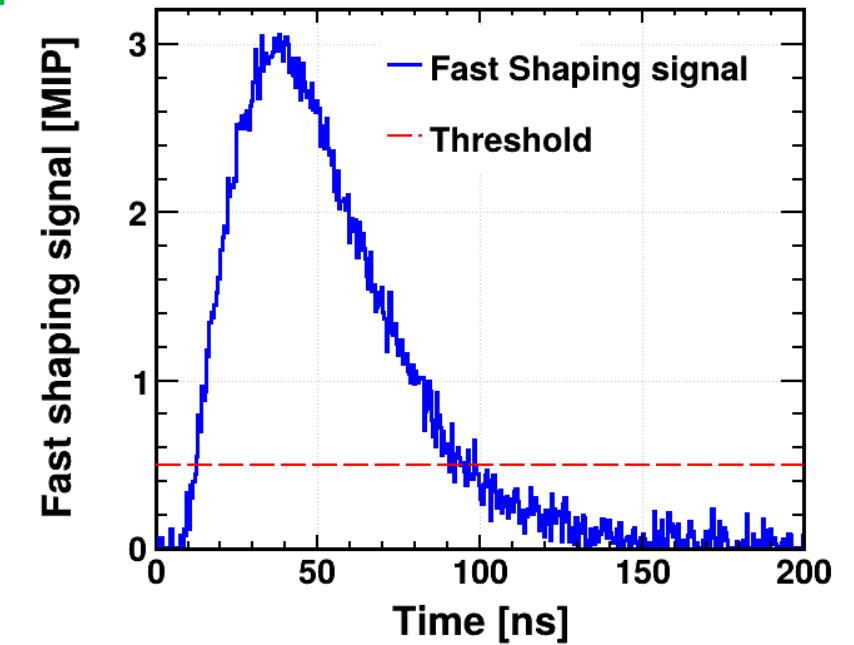

Beam

SKIROC chips

Slow shaping channel records signals

Fast shaping channel provides triggers

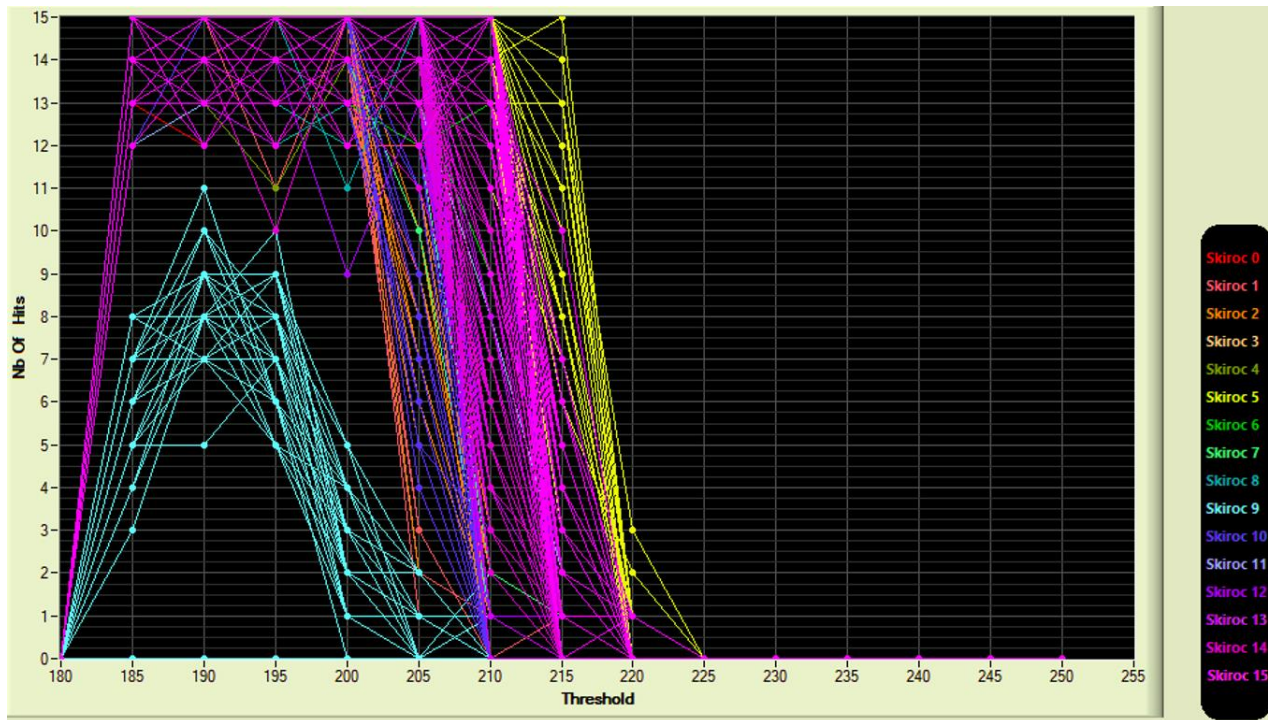

Out Line

- Background
- Commissioning
- Position Scan
- TDC
- Summary and outlook

Commissioning

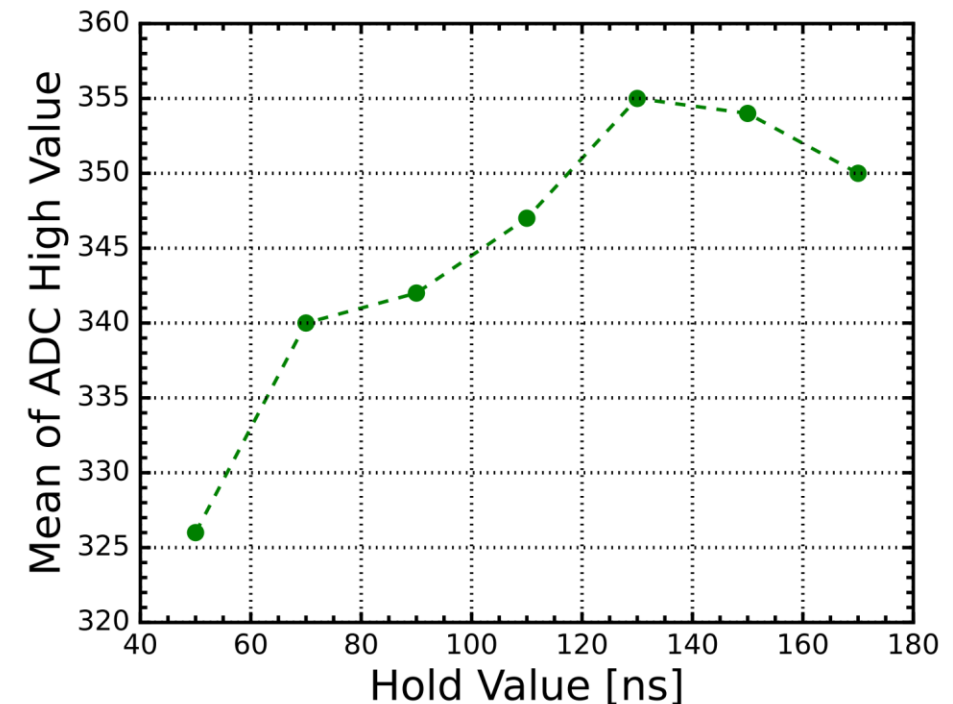

Threshold

- Scanning was processed separately for each channel without signal
- A threshold of **230 ADC** was applied during the beam test, with exceptions for certain chips in specific runs.

Hold value

- Hold value was scanned with beam on
- The hold value was set up as **130 DAC**(1 DAC is approximately 1 ns)

Configuration optimization: Threshold(left) and hold value(right)

Masking

- Noisy channels were masked by a scanning program in a short time(5-10min)
- **Layer 8:** 114 channels were masked
- **Layer 11:** 65 channels were masked, including the whole **chip9**
- **Layer12:** 4 channels were masked

Map for masked channels, from left to right: layer 8, layer 11 and layer12

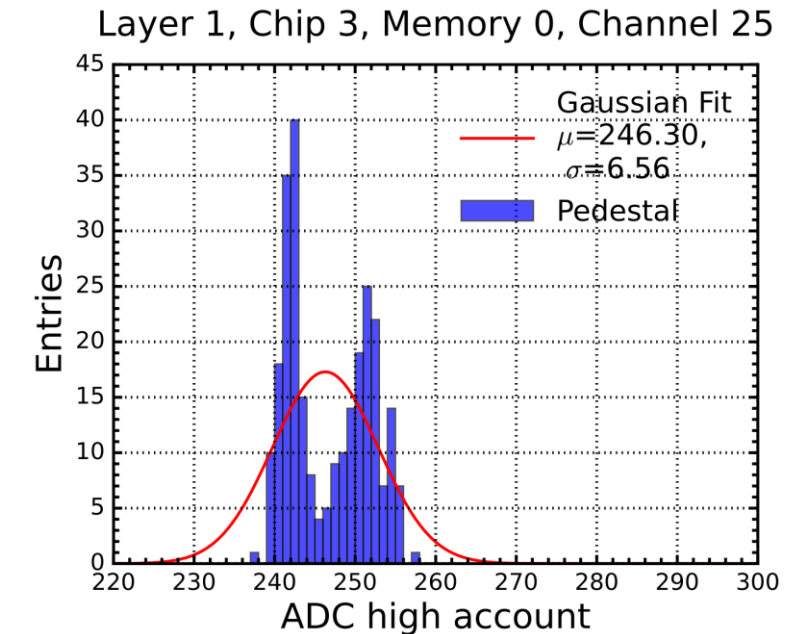

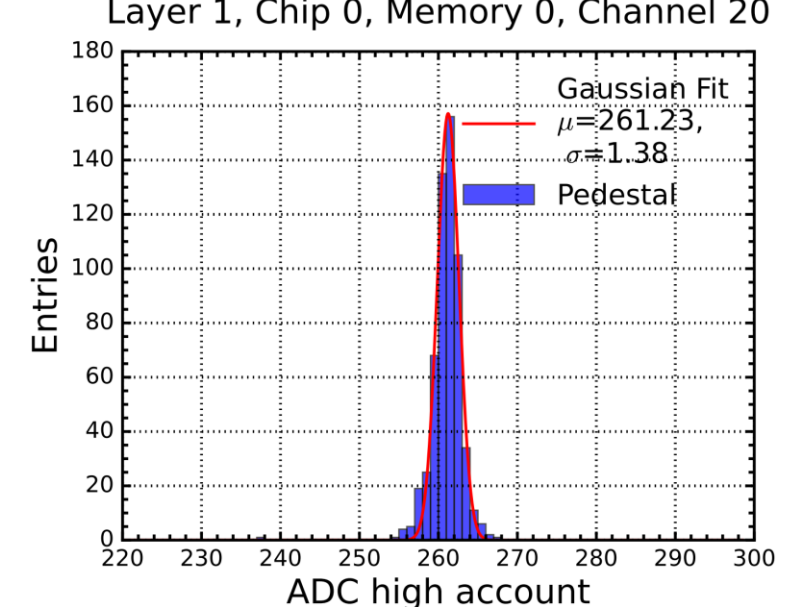

Pedestal

Data acquisition

- Select channels of which the hitbit=0
- Pedestal routine runs: self triggered by charge injection
- Data runs: the unhit channels

Analysis

- Normal channels: use gaussian fit to get the pedestal value and sigma
- Multi-peaks: caused by non-uniformity between different memory depth, crosstalk between channels, retriggering.
- Channels with a sigma > 4 are likely to have multi-peaks

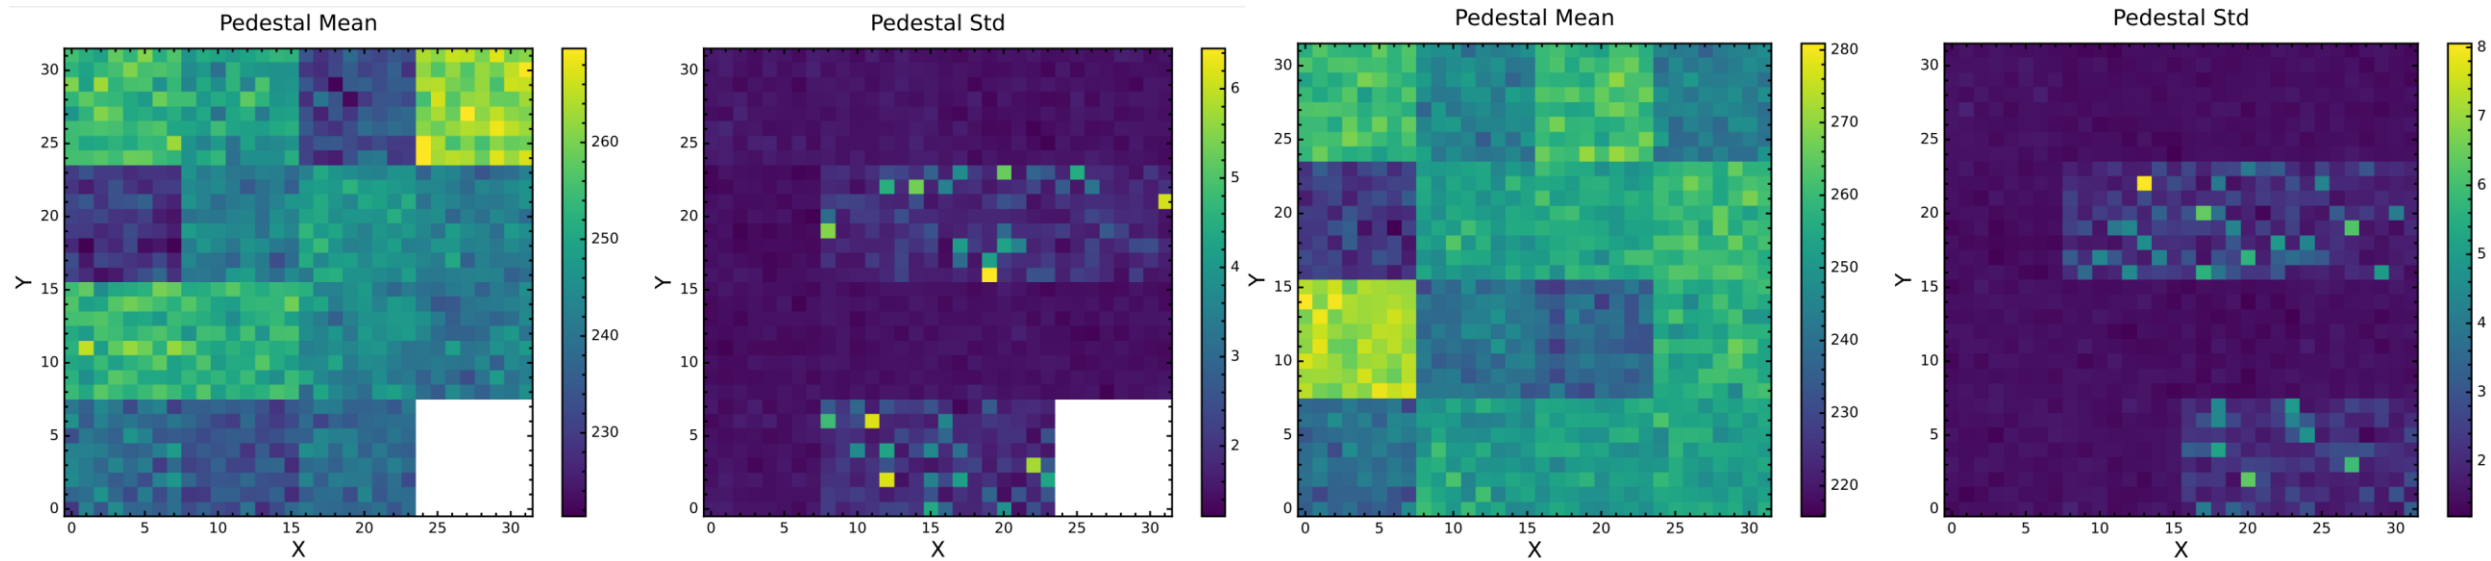

Pedestals from different channels

Pedestal Map

Differences on pedestals were observed among:

- Chips
- Memory cells
- Pedestal routine runs and data taking runs

Further investigation is required

Pedestals from different layers: layer11(left) and layer12(right)

Out Line

- Background
- Commissioning
- Position Scan
- TDC
- Summary and outlook

Position Scan

Statistics

- Layer 8 suffer from the masked channels
- Most channels in layer 11 and 12 have adequate statistics(>1000)

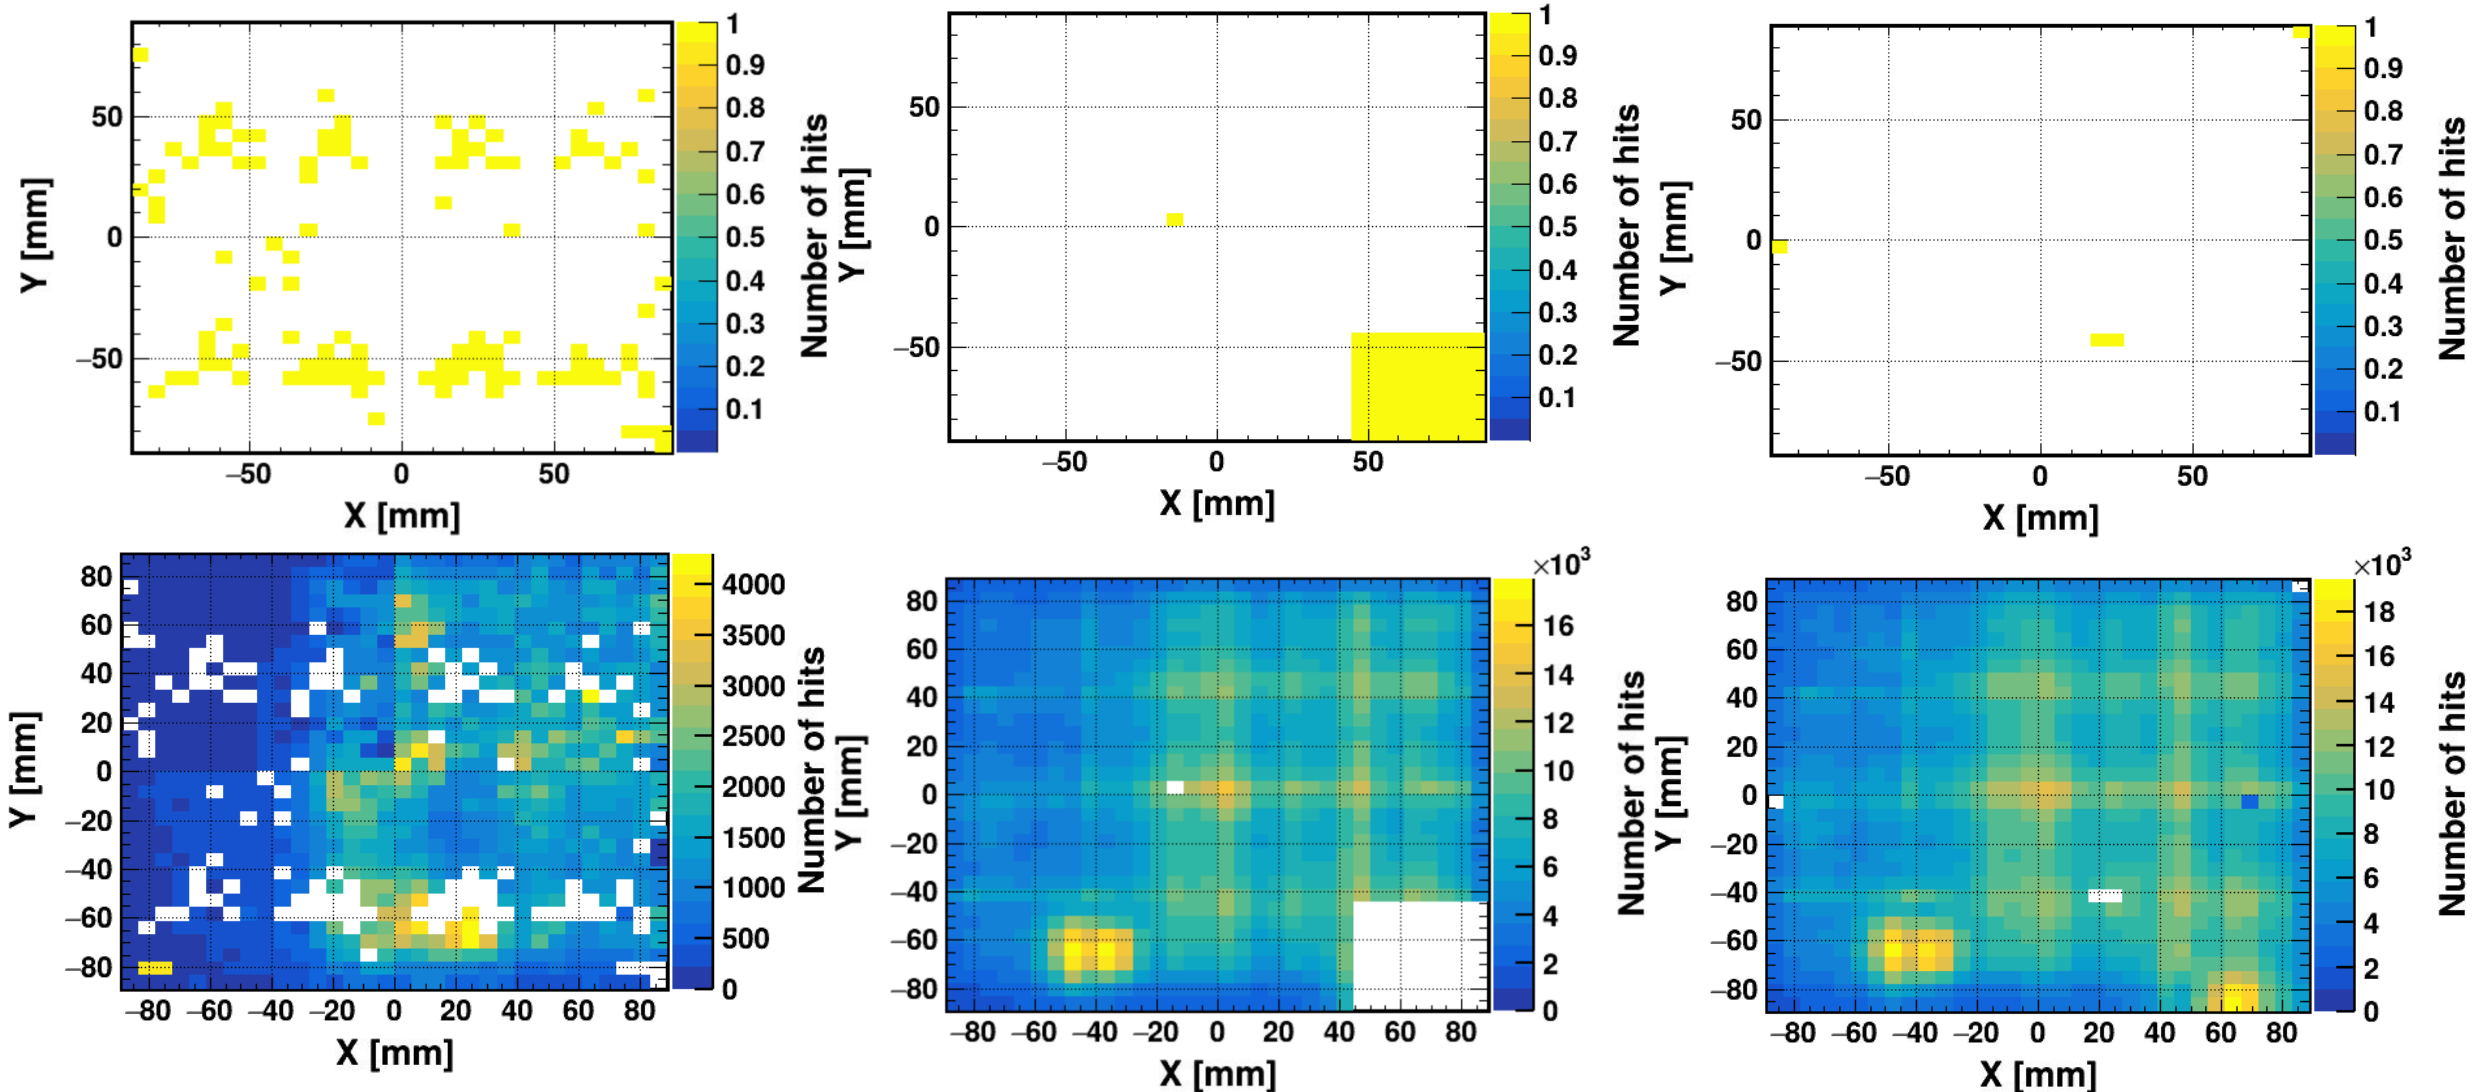

Event Number of layers

Statistics in each channel

Hit Map

The hit maps are in consistency with the masking channels

Mask map(up) andHit maps(down): layer 8, layer11 and layer12

Signal Noise Ratio(S/N)

- Pedestal is obtained by the beam data with hitbit=0
- High gain: MPV ~ 90 ADC(after pedestal extraction), S/N ~ 30
- Low gain: MPV ~ 23 ADC, S/N ~ 11

Single channel's S/N for high gain and low gain

Out Line

- Background
- Commissioning
- Position Scan
- TDC
- Summary and outlook

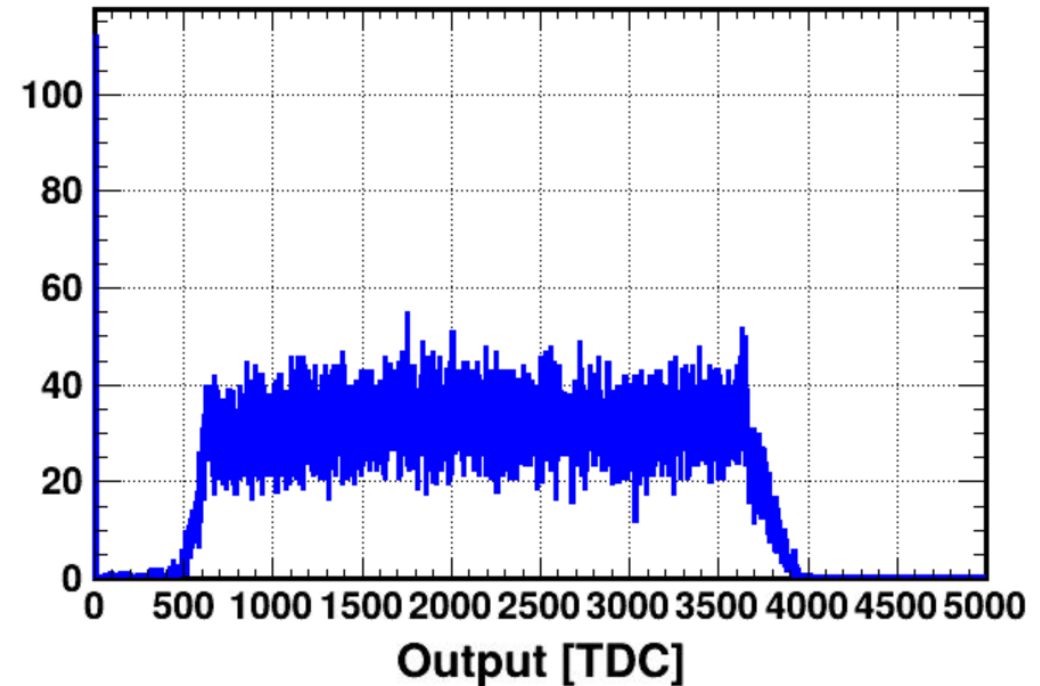

TDC

Configuration

- Autogain mode was activated, Beam aimed at center of the ECAL
- Different fast shaping times were tested across various runs
- 1 TDC is approximately 0.6 ns, needs further calibration

Hit Map of layer 12

TDC mode out put

- Commissioning
- Position Scan
- TDC
- Summary and outlook

Summary and Plan

- **Summary**

- Two new ECAL layers, along with the COB layer, underwent two weeks of commissioning followed by a one-week beam test at DESY. The fundamental functionalities of these layers were successfully validated.

- **Plan**

- More details on the pedestal, chip9 in layer11 and TDC should be further investigated
- The time performance of the ECAL layers will be analyzed, modeled and integrated into ECAL simulation and reconstruction
- A total of 15 new ECAL layers are planned, with a beam test at CERN scheduled for 2026

"The research leading to these results has received funding from the European Union's Horizon Europe research and innovation programme under grant agreement no. 101057511."

BACK UP

TDC

Event Selection

Hits position coincidence:

difference in X and Y should be less than 2 cell size(11 mm)

Layer 11 used as reference layer

The SNR of the trigger circuit is not obtained in the test beam data, plotted in this slide is the SNR for slow shaping channel

Run 90767

Shaping

Shaping signal function

- $S(t) = \sum_i^{subhits} f_{scale} \frac{E_i \cdot T_i^n(t) \cdot e^{-T_i(t)}}{n!} \otimes gauss(0, noise)$
- $f_{scale}=4$
- $T_i(t) = (t - t_i^{hit})/\tau$
 - fast shaping: $\tau_{fast} = 30 \text{ ns}$
 - slow shaping: $\tau_{slow} = 180 \text{ ns}$

- Order of CR_RC filter
 - $n_{fast} = 2$
 - $n_{slow} = 2$
- Noise
 - Fast: 1/12 MIP
 - Slow: 0.05 MIP

Digi Hit

- t_{Digi} : the time when $S_{fast}(t_{Digi}) > 0.5 \text{ MIP}$
- Energy: Slow shaping signal after delay $S_{slow}(t_{Digi} + t_{delay})$
- delay time: 160ns

Validation of this model?
Beam test at DESY in
March this year

Digitization for Fast shaping(left) and slow shaping(right)

Decoding

Data profile

- Binary✓
 - Run:090560-090650
 - DecodedVictor code:eudaq = false
 - package ends with 0xEEEEEEEE
- ASCII(.dat)
 - Run:090651-090704
 - No decoding algorithm
- Raw✓
 - Run:090560-090768
 - All Test Beam runs
 - DecodedVictor code:eudaq = true
 - package starts with 0xABCD
- Slcio
 - Run:090557-090768
 - Some cosmic runs are included
 - No decoding algorithm

Difference between Data profiles

- Binary vs Raw
 - They were exactly the same except the layer ID
 - Binary:0,1,2
 - Raw:8,11,12

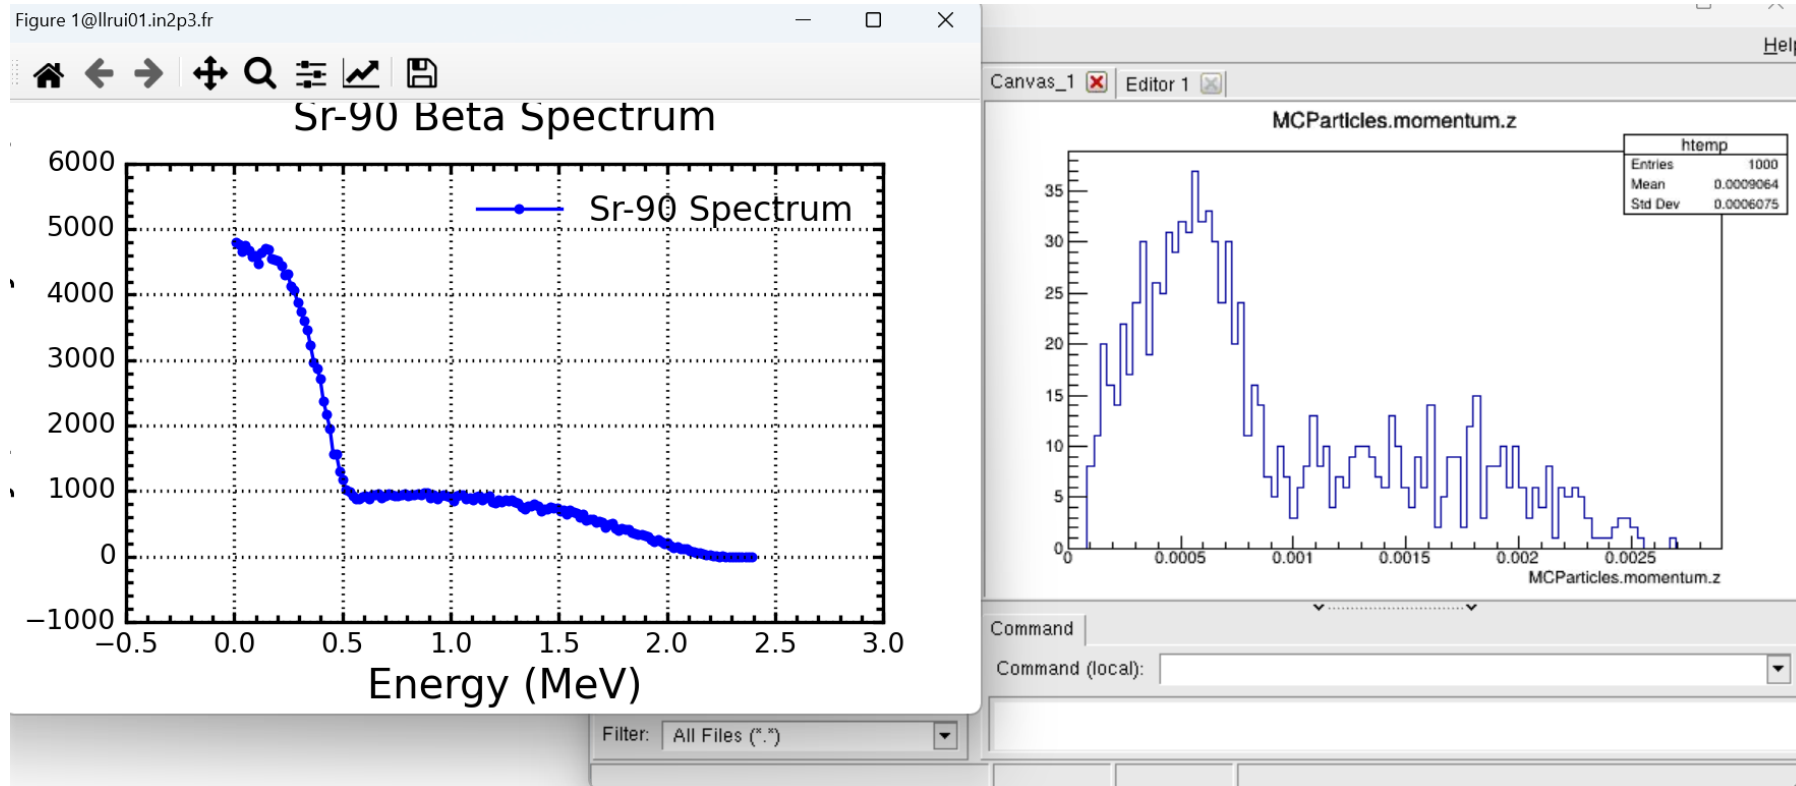

2 Proposals

- Use the rootfiles converted from raw files for future analysis
- Make a datalist for all beam data with description for runs, like pedestal, position scan, etc.

Sr90 Setup

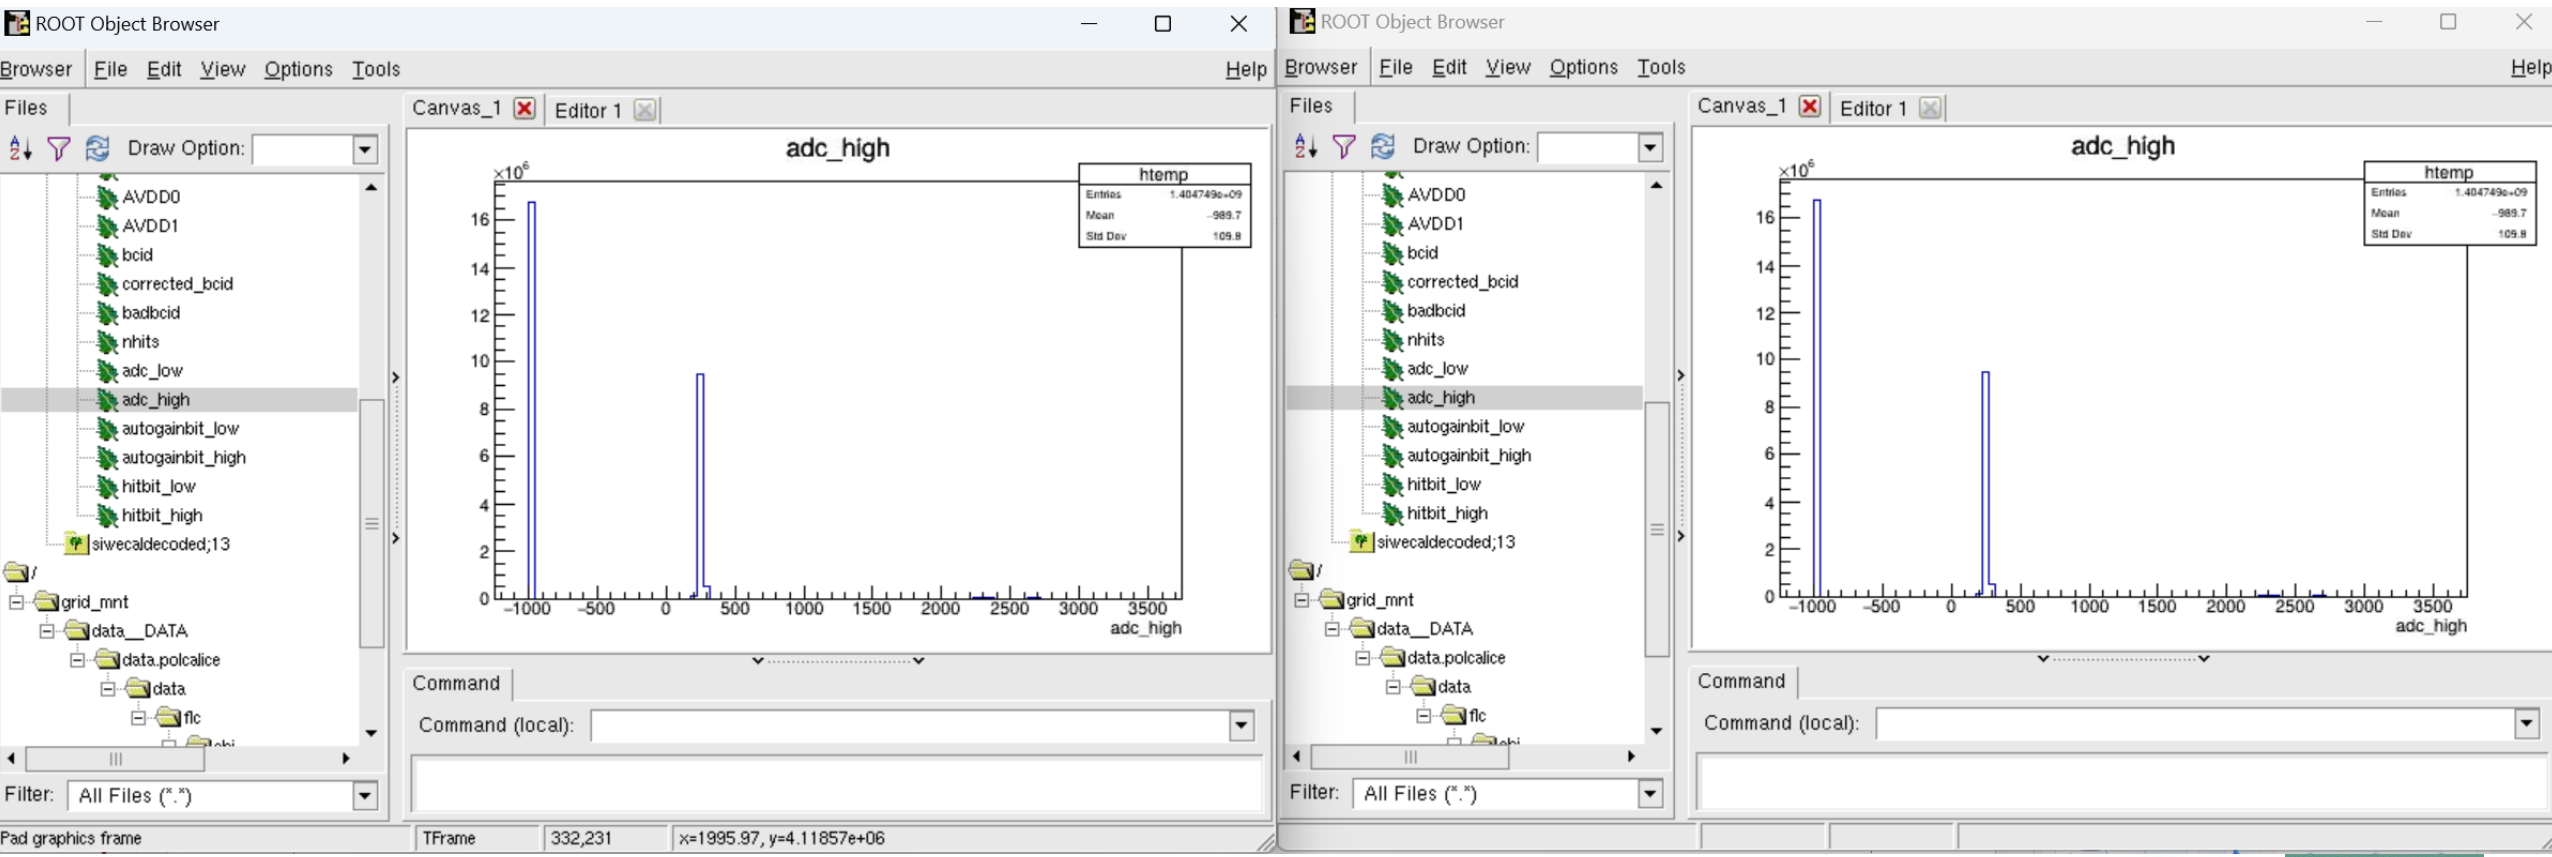

Left: draw from the Sr90 input file

Right: MC Pz, /gps/direction 0 0 1

Different ways to convert root files

- .bin-> root
- .raw->root

- They are exactly the same
 - using run90623
 - Layer id is different for .bin & .raw

Position Scan

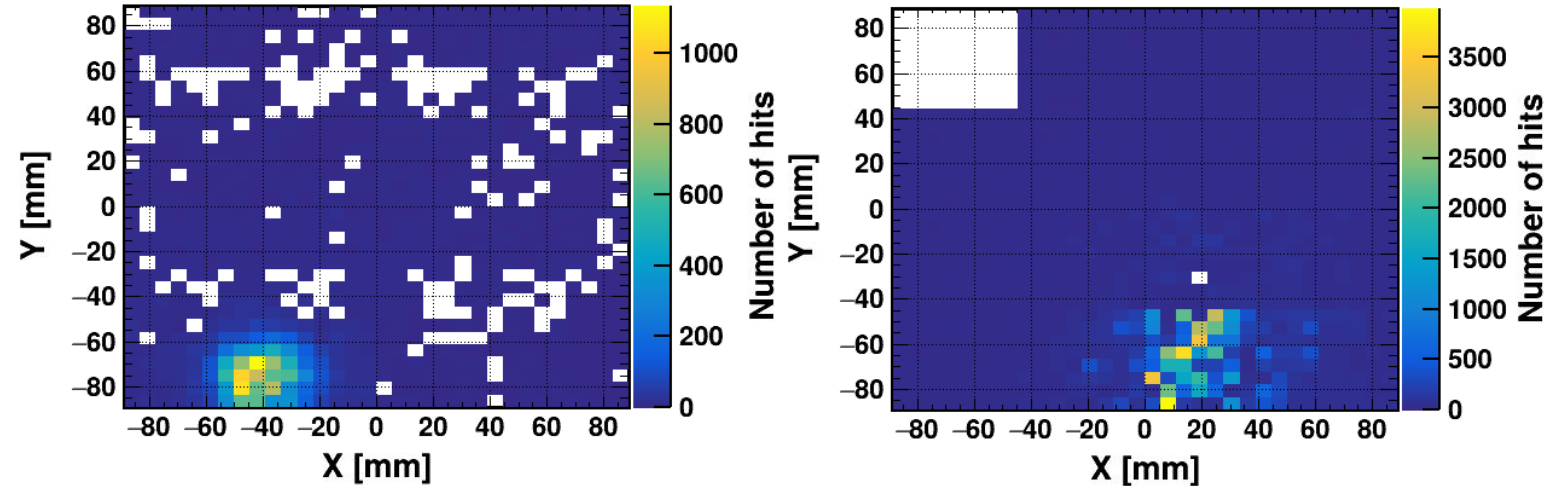

Data profile

- ECAL alone
 - 90623 – 90646
 - 90651- 90704
- ECAL+AHCAL
 - 90722-90725

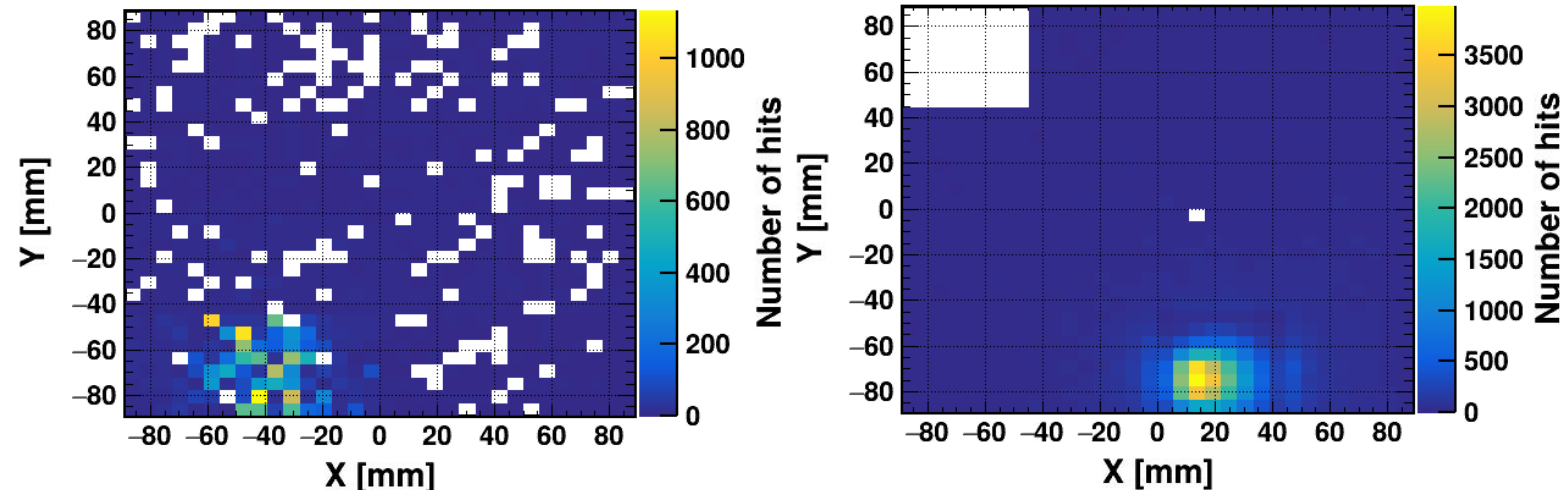

Mapping

- fev11_cob_rotate_chip_channel_x_y_mapping.txt matches layer 8
- fev10_chip_channel_x_y_mapping.txt matches layer 11 & 12
- The hit map is consistent with the one on Elog with proper mapping file

Hit Map of run 090660

Fev11_cob_rotate: layer8(left) and layer11(right)

Fev10: layer8(left) and layer11(right)

Datalist TDC

Run Number	Hits	Fast Shaper	Delay	Comments
90748	~1M	90 ns	150 ns	AutoGain- Force Low Gain; shooting in ASIC 0 Seemingly flat TDC dsitribution in ASIC 0~1M
90749	~1M	30 ns	90 ns	Much narrower distribution from 1200--2000 in ASIC 0 "High Gain" see attachement 6; NO TDC
90750	50000	60 ns	90 ns	no TDC.
90751		90 ns	150 ns	idem 90748. Configurion is back to non-TDC ?
90760		90 ns	130 ns	
90761	1142189	90 ns	150 ns	
90762	Failed			
90763	small test	90 ns	150 ns	ALL ASICs
90764, 90765	Large !			At center of the the ECAL; All TDC, 90 ns, 130 ns
90766, 90767	2 x 1.15M	30 ns	150 ns	Distributions seems OK (beam spot, TDC).
90768, 90769				Final Pedestal runs

MIP map and pedestal map of position scan run

- Data:
Run_number = "090623 which is position scan run.
- Different pedestal map with pedestal run. First study, Need further study.
- $MIP \approx 24$
