P(ND)<sup>2-3</sup> : Perspectives on Nuclear Data for the Next Decade

SESSION : Setups for Cross sections

# 1. The EPIC project

- Why?
- Which setup?

# 2. Feasibility studies

- In beam test at LANSCE
- In beam test at GELINA

# 3. Conclusions

- Milestones

# 1 ■ EPIC

- 1) nuclear data need
- 2) experimental set-up

# Why measuring <sup>even</sup>Pu fission cross section

## Nuclear data need for fast reactors

- Fast reactor performance strongly driven by Pu nuclear data uncertainties
- <sup>242,240,238</sup>Pu: role in Pu-based fuels (MOX and multi-recycling scenari)
- But, significant uncertainties in neutron-induced fission cross section
- New high-precision measurements are required (cf. HPRL)

[https://www.oecd-nea.org/jcms/pl\\_68746/](https://www.oecd-nea.org/jcms/pl_68746/)

## NEA Nuclear Data High Priority Request List - HPRL

The NEA Nuclear Data High Priority Request List (HPRL) is a compilation of the most important nuclear data requests that have been rigorously reviewed by the NEA Working Party on International Nuclear Data Evaluation Co-operation (WPEC).

ID ↑	Type	Target ↑	Reaction ↑ (n,f) ↓	Quantity ↑ SIG ↓	Energy		Accuracy (%)
					Min	Max	
39	H	94-Pu-242	(n,f)	SIG	200 keV	20 MeV	4-15
37	H	94-Pu-240	(n,f)	SIG	0.5 keV	5 MeV	2-13
19	H	94-Pu-238	(n,f)	SIG	9 keV	6 MeV	3-24

# Why measuring <sup>even</sup>Pu fission cross section

## Nuclear data need for fast reactors

- Fast reactor performance strongly driven by Pu nuclear data uncertainties
- <sup>242,240,238</sup>Pu: role in Pu-based fuels (MOX and multi-recycling scenari)
- But, significant uncertainties in neutron-induced fission cross section
- New high-precision measurements are required (cf. HPRL)

## NEA Nuclear Data High Priority Request List - HPRL

The NEA Nuclear Data High Priority Request List (HPRL) is a compilation of the most important nuclear data requests that have been rigorously reviewed by the NEA Working Party on International Nuclear Data Evaluation Co-operation (WPEC).

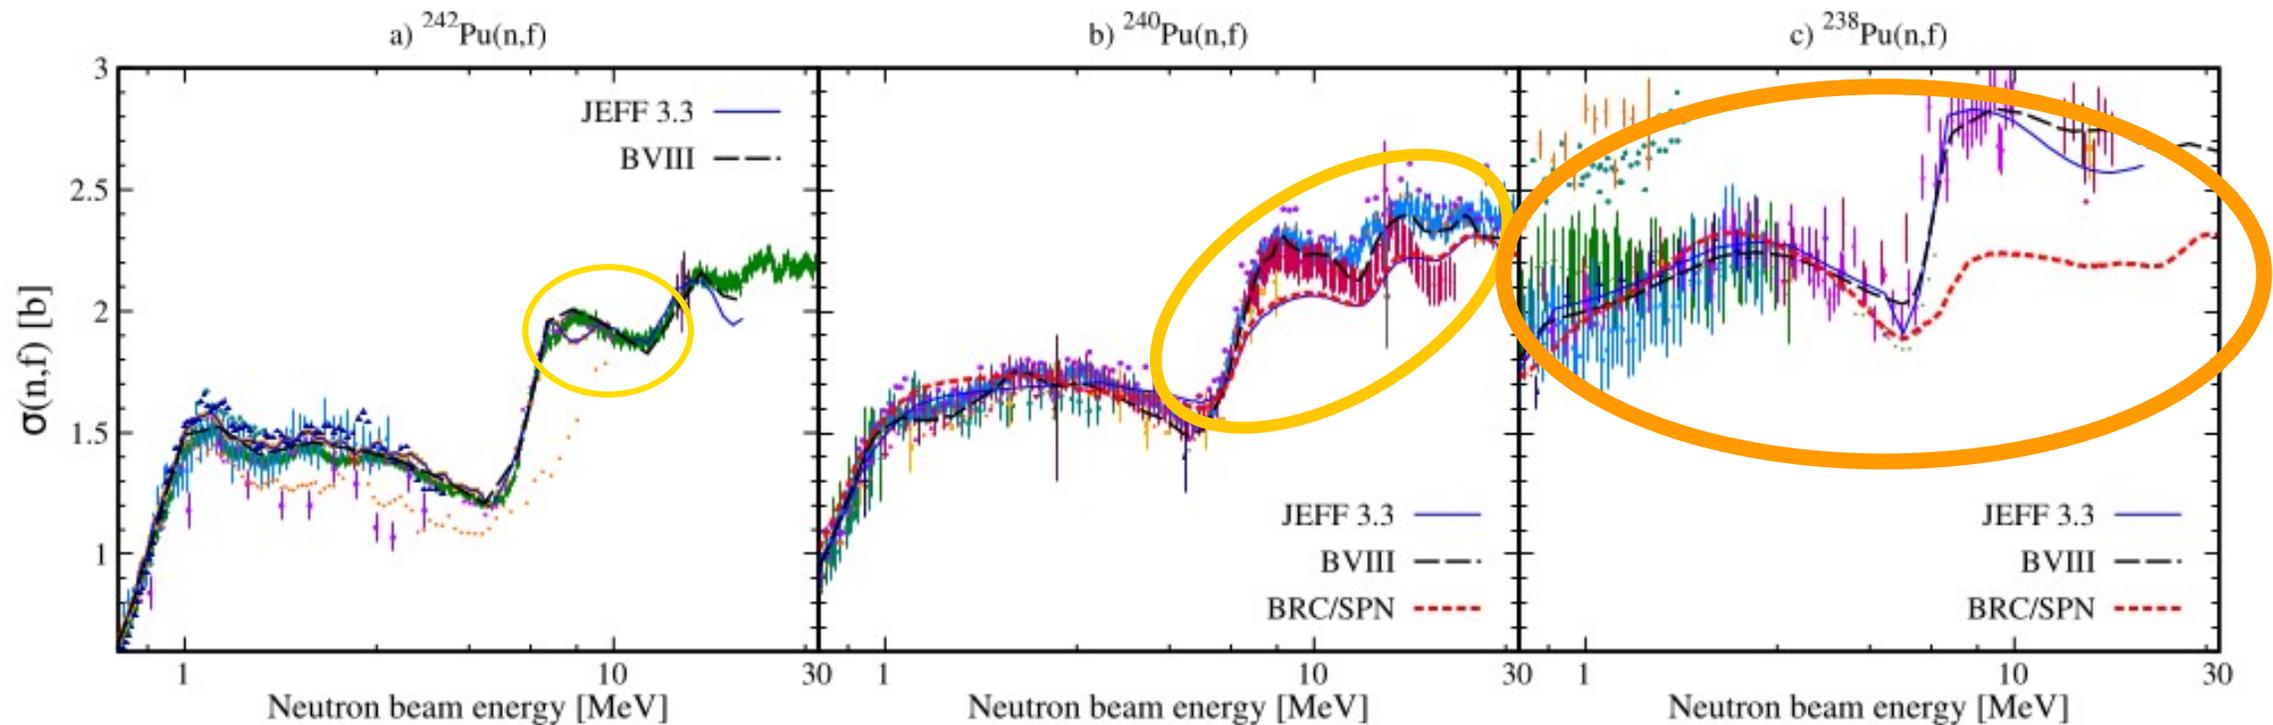

ID ↑	Type	Target ↑	Reaction ↑ (n,f) ↓	Quantity ↑ SIG ↓	Energy		Accuracy (%)
					Min	Max	
39	H	94-Pu-242	(n,f)	SIG	200 keV	20 MeV	4-15
37	H	94-Pu-240	(n,f)	SIG	0.5 keV	5 MeV	2-13
19	H	94-Pu-238	(n,f)	SIG	9 keV	6 MeV	3-24

GOAL: provide new data at [1:25] MeV, with 3% accuracy

# GOAL: $^{even}\text{Pu}(n,f)$ cross section relative to $^{235}\text{U}(n,f)$

For neutron beam energy from 1 MeV up to 20 MeV, with 3% uncertainty

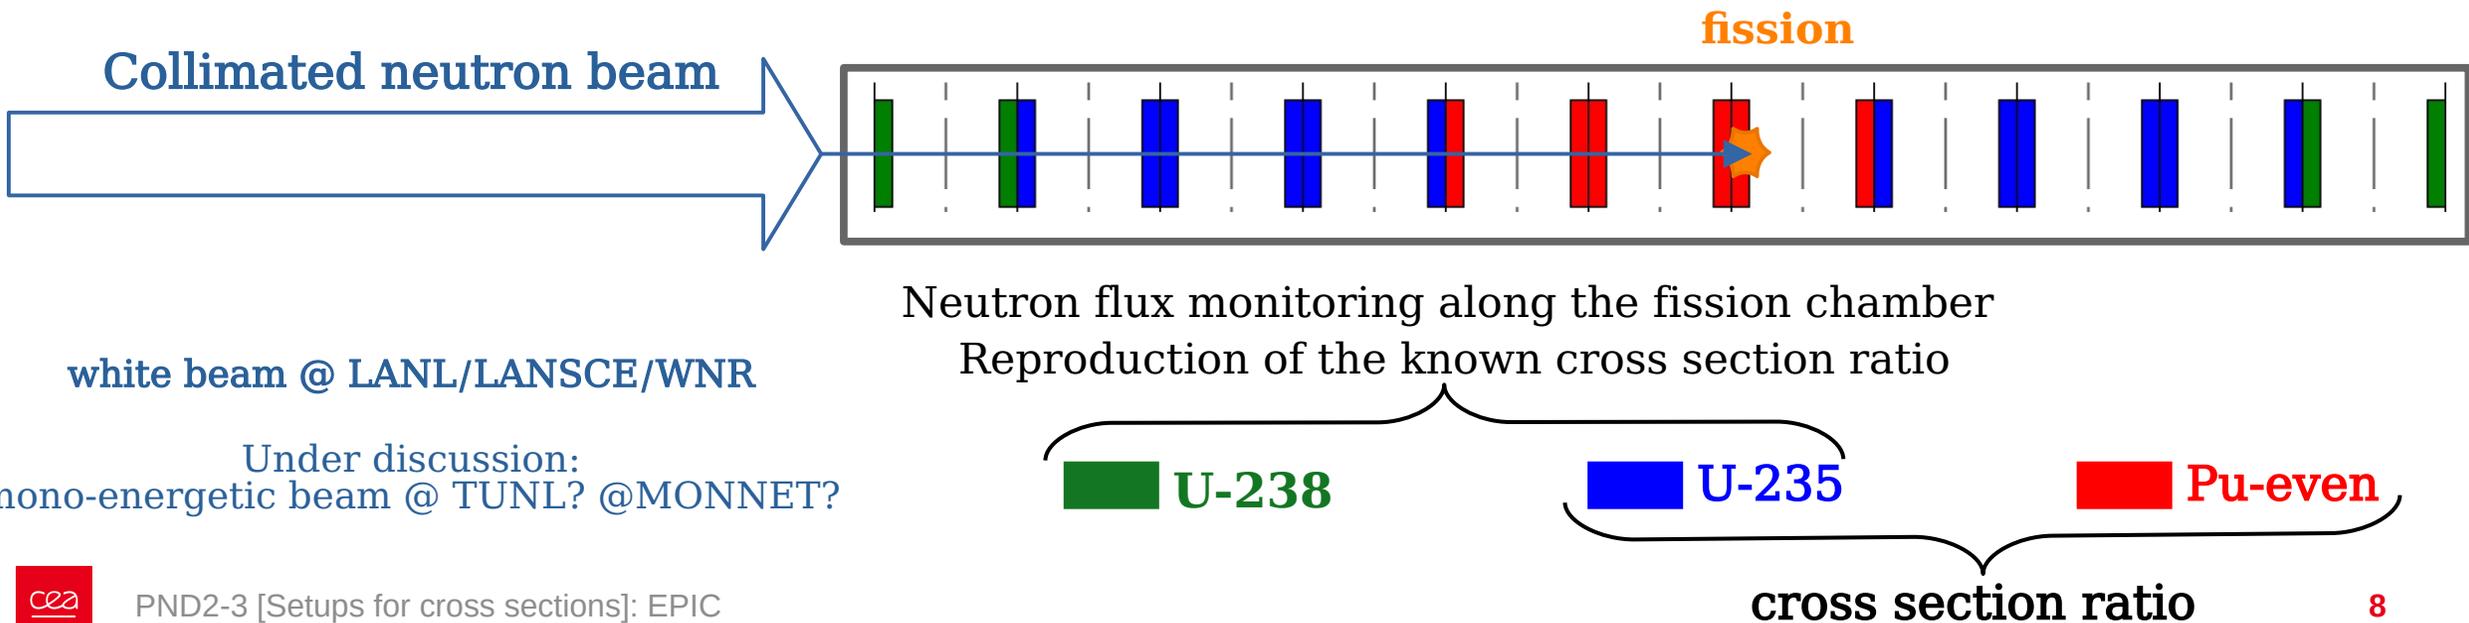

- Comparison data sets / evaluations
- $^{238}\text{Pu}$ : very difficult case due to high alpha activity ( $T_{1/2}=82.5\text{y}$ )

# METHOD: $^{even}\text{Pu}(n,f)$ cross section relative to $^{235}\text{U}(n,f)$

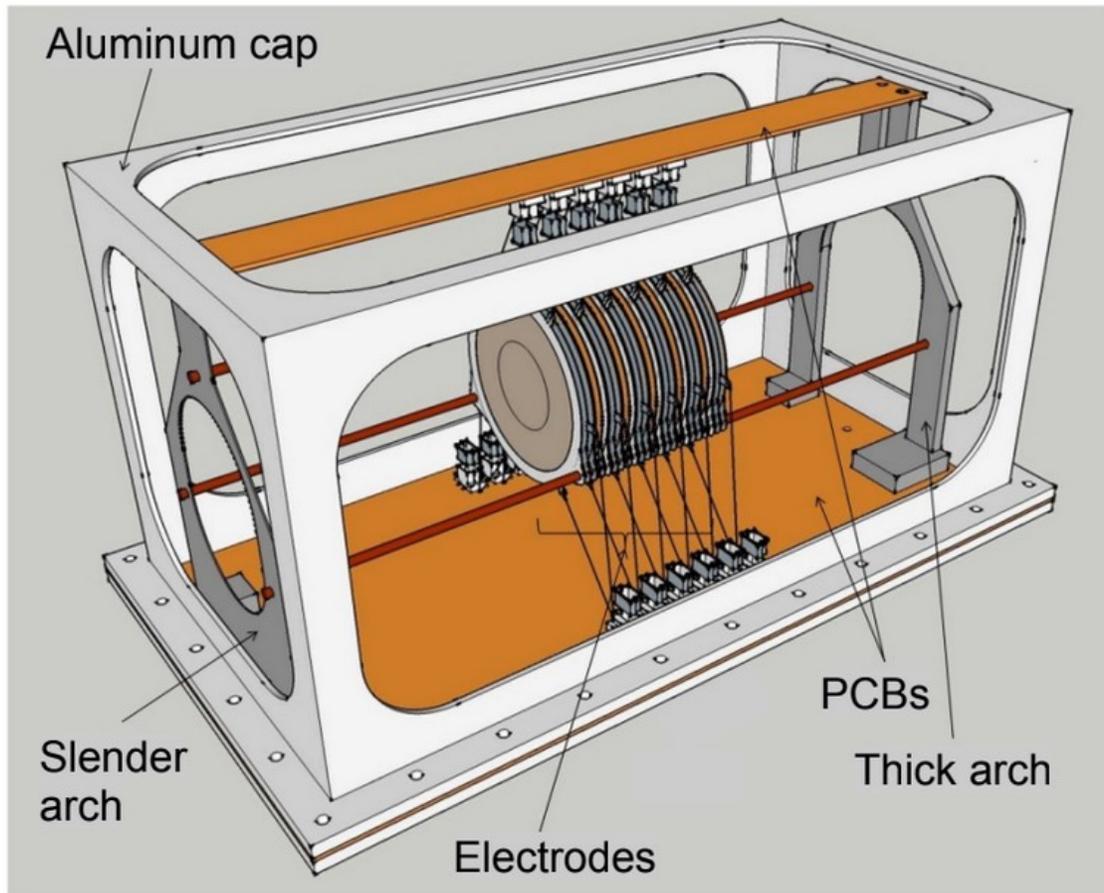

For neutron beam energy from 1 MeV up to 20 MeV, with 3% uncertainty

- Experimental set-up: **multi-body fission chamber** in a collimated neutron beam
- Ratio  $^{even}\text{Pu}/^{235}\text{U}$ : modulo fission anisotropy, all sources of efficiency loss are the same  
no need to have an absolute measurement of the neutron flux

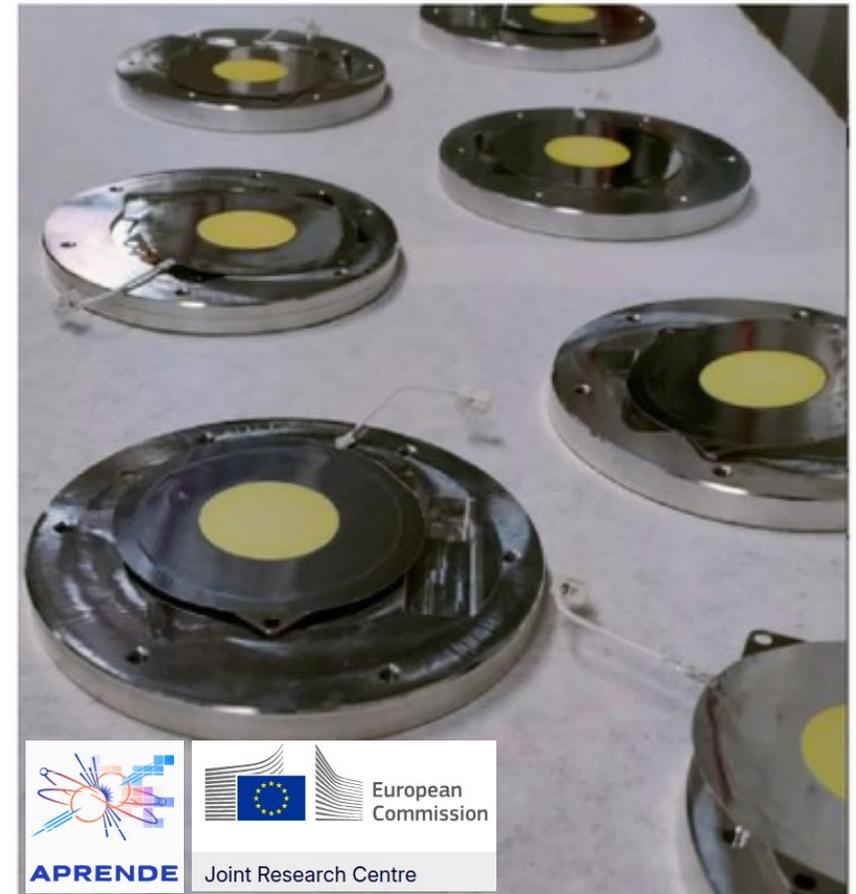

# The fission chamber

*Scheme of the fission chamber*

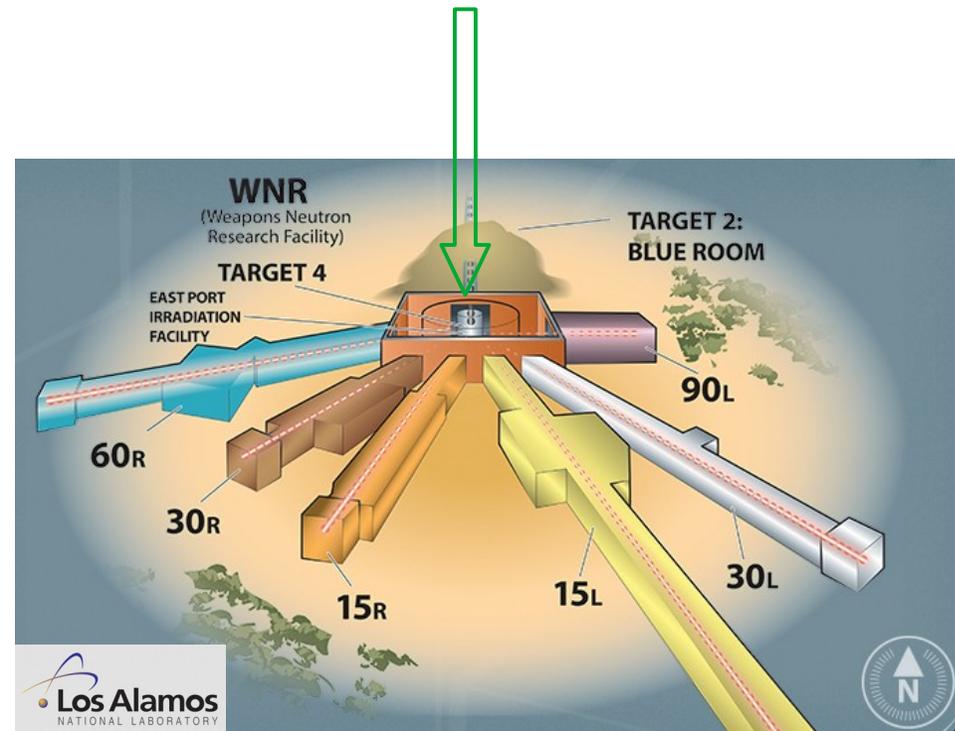

*Samples are produced at [JRC-Geel](#)*

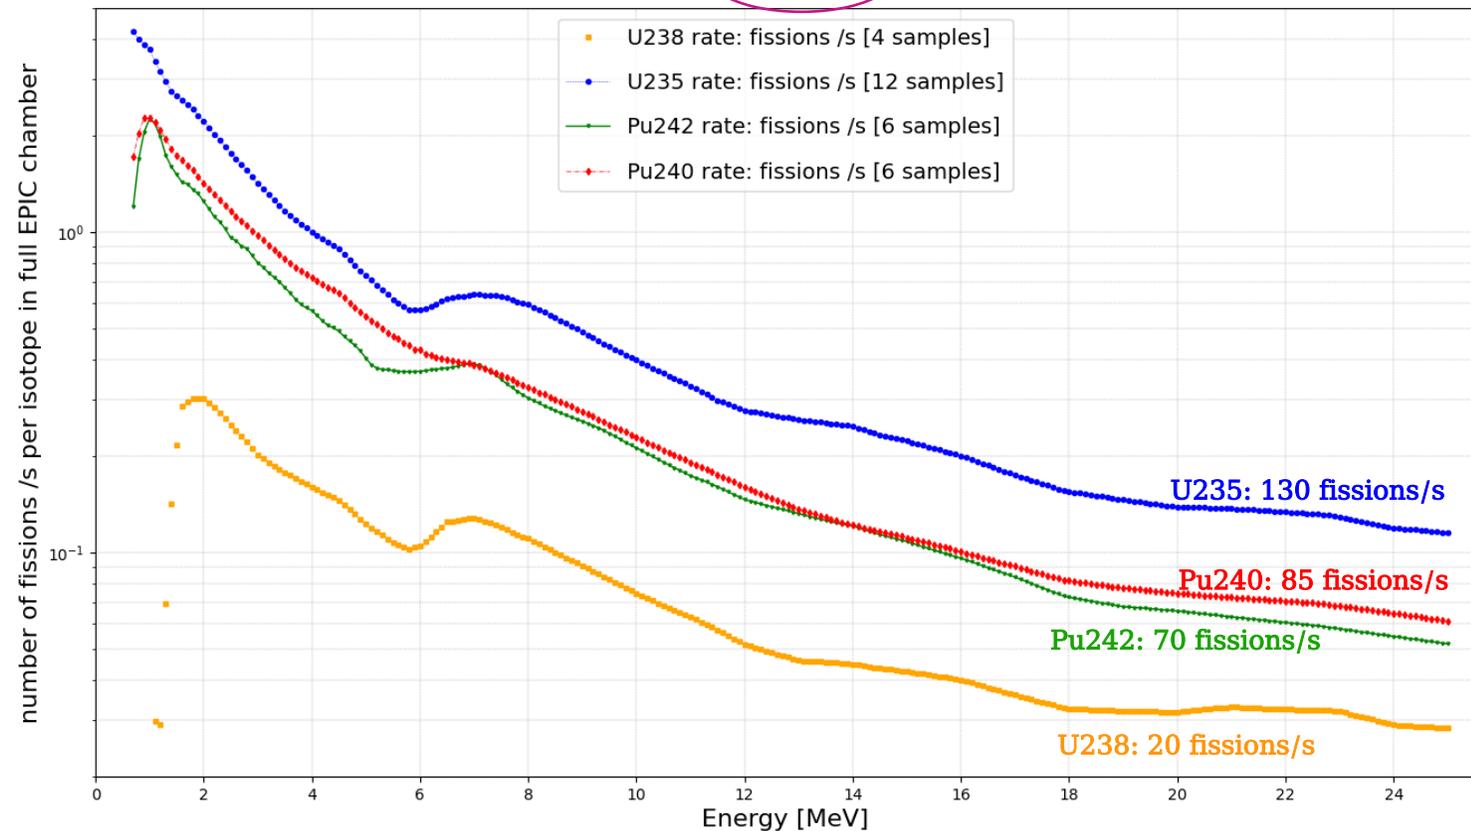

# The neutron beam at WNR / T4 / FP15L

WNR facility : neutron produced by spallation from 800MeV-p on W target

800MeV proton beam

fission rates /s /100keV, if  $I_p=2$  uA, full EPIC chamber

# DIFFICULTY: accuracy

For neutron beam energy from 700 keV up to 25 MeV, with 3% uncertainty

- Need to fully master (and maximize) the **efficiency** of the chamber
  - **alpha / fission discrimination** : alpha-decay and (n, $\alpha$ ) reactions
  - **thin 50  $\mu\text{g}/\text{cm}^2$  actinide targets**: to recover all fragments stopped in thicker targets  
to minimize the energy loss of FF versus alpha pile-up  
operation at higher pressure
  - new electronics
- Need of **high statistics** per bin, at least  $10^4$  per bin of neutron energy
  - Measurement foreseen with the white spallation neutron beam at LANSCE / WNR  
3 weeks measurement for  $^{242}\text{Pu}$  and  $^{240}\text{Pu}$  cases for 100 keV bin
  - $^{242}\text{Pu}$  experiment accepted, will be scheduled in 2026

# 2 ■ Feasibility study

- 1) starting point: fission chamber for PFNS
- 2) first in-beam test at LANSCE in Nov. 2025
- 3) second in-beam test at GELINA in Jun. 2026

# Fission chamber for PFNS $^{239}\text{Pu}(n,f)$

## Alpha / fission discrimination capability for 10 MBq / anode

- P. Marini et al., PRC 101, 044614 (2020)
- Fission chamber efficiency  $\sim 95\%$
- Maximum activity : 10 MBq / anode
  - targets produced at JRC Geel
  - start with  $^{242,240}\text{Pu}$  cases with  $50 \mu\text{g}/\text{cm}^2$
  - on-going development for  $2 \mu\text{g}/\text{cm}^2$   $^{238}\text{Pu}$

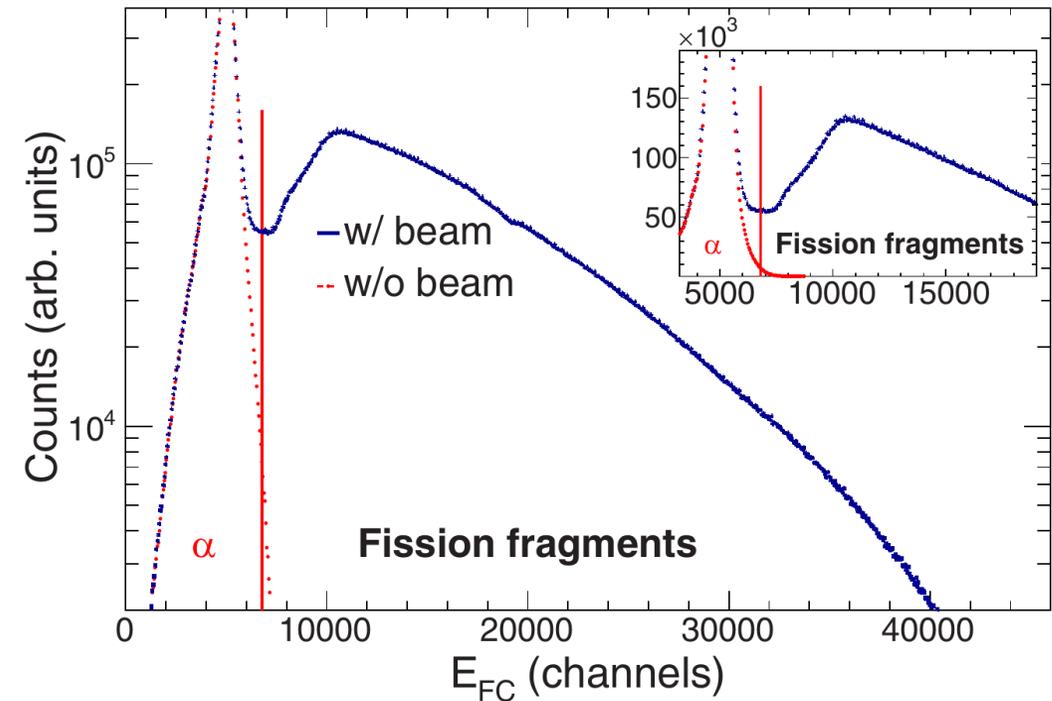

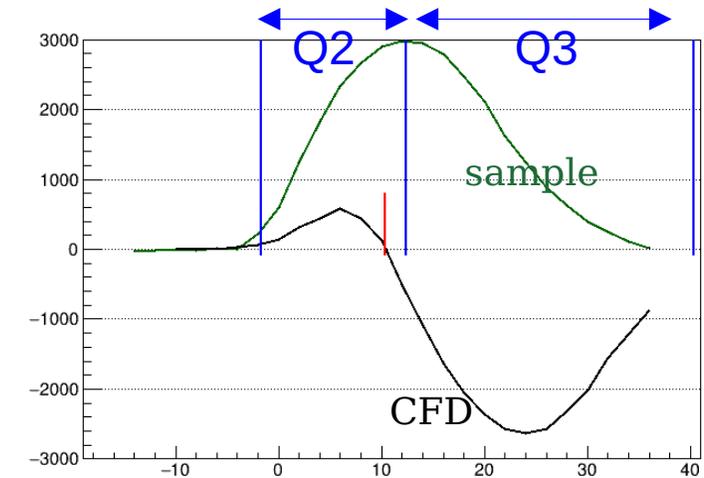

FIG. 4. Pulse height spectra of  $^{239}\text{Pu}$  fission chamber obtained with (blue) and without (red) beam. The vertical red line indicates the cut used in the data analysis to separate  $\alpha$  particles from fission fragments (see Sec. III A 1).

# First in-beam test at LANSCE in Nov. 2025

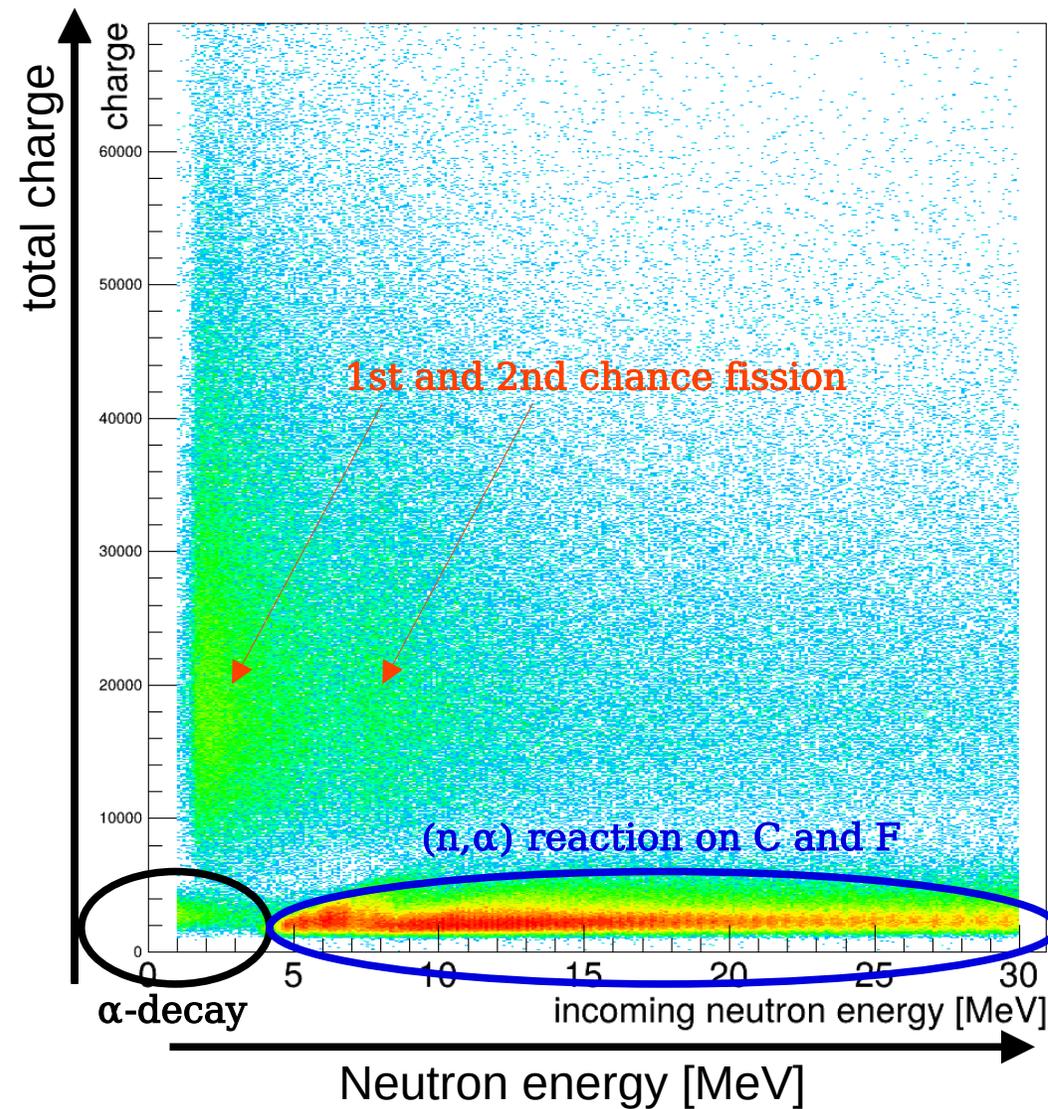

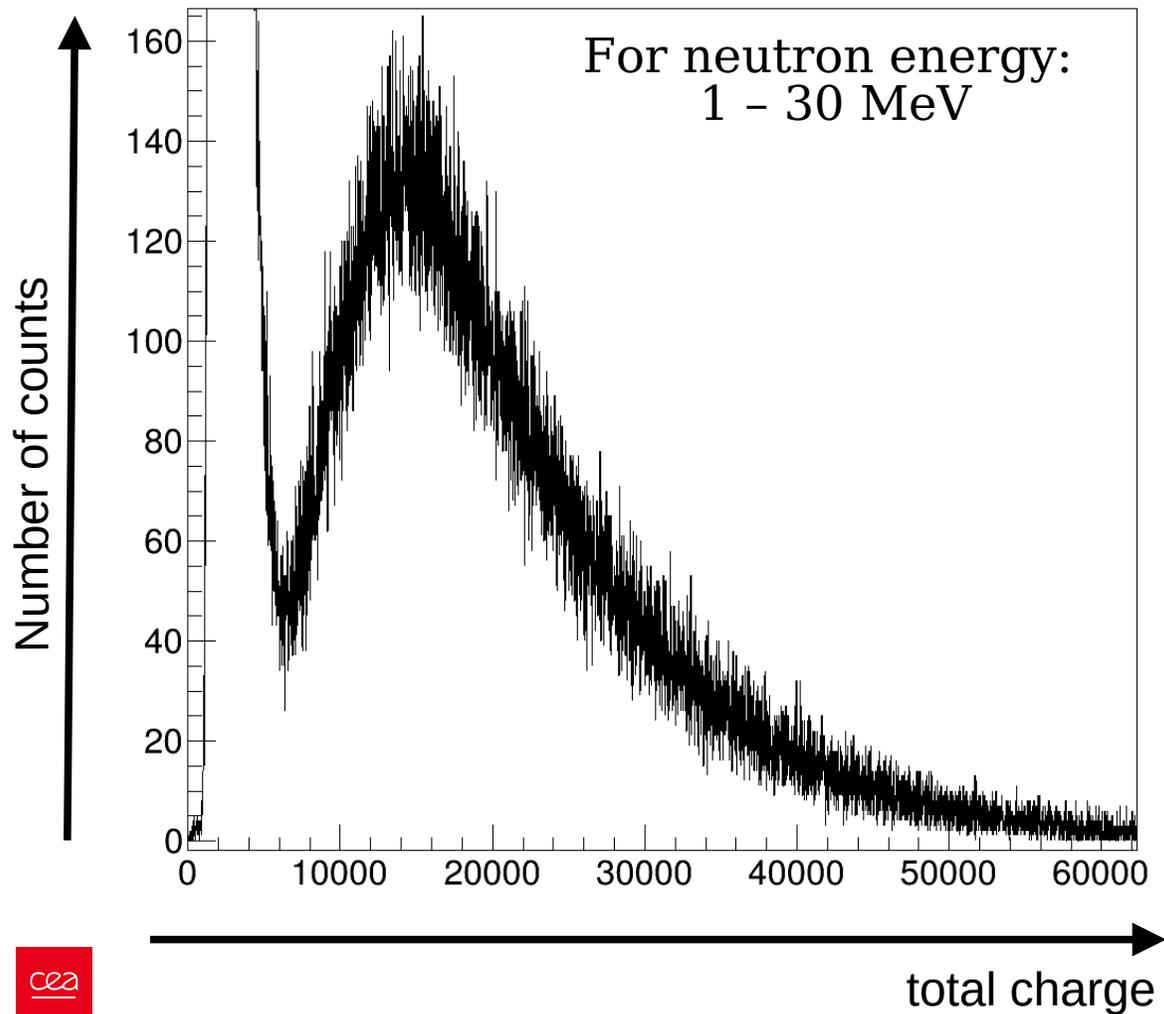

## Parasitic mode behind a set-up with a lot of scattered neutrons

- With a U8/U5 chamber with available thicker samples:
  - 250  $\mu\text{g}/\text{cm}^2$  samples in EPIC chamber to sustain high gas pressure
  - limitation to observe influence of gas pressure
  - equipped with former PA generation (stable PA)
- With a  $^{240}\text{Pu}$  chamber
  - 50  $\mu\text{g}/\text{cm}^2$  samples in standard PFNS chamber
  - new PA with high bandwidth
  - encouraging despite instability (5PA max)
- All signals sampled for PSD (= Q2/Q3 vs Qtot)

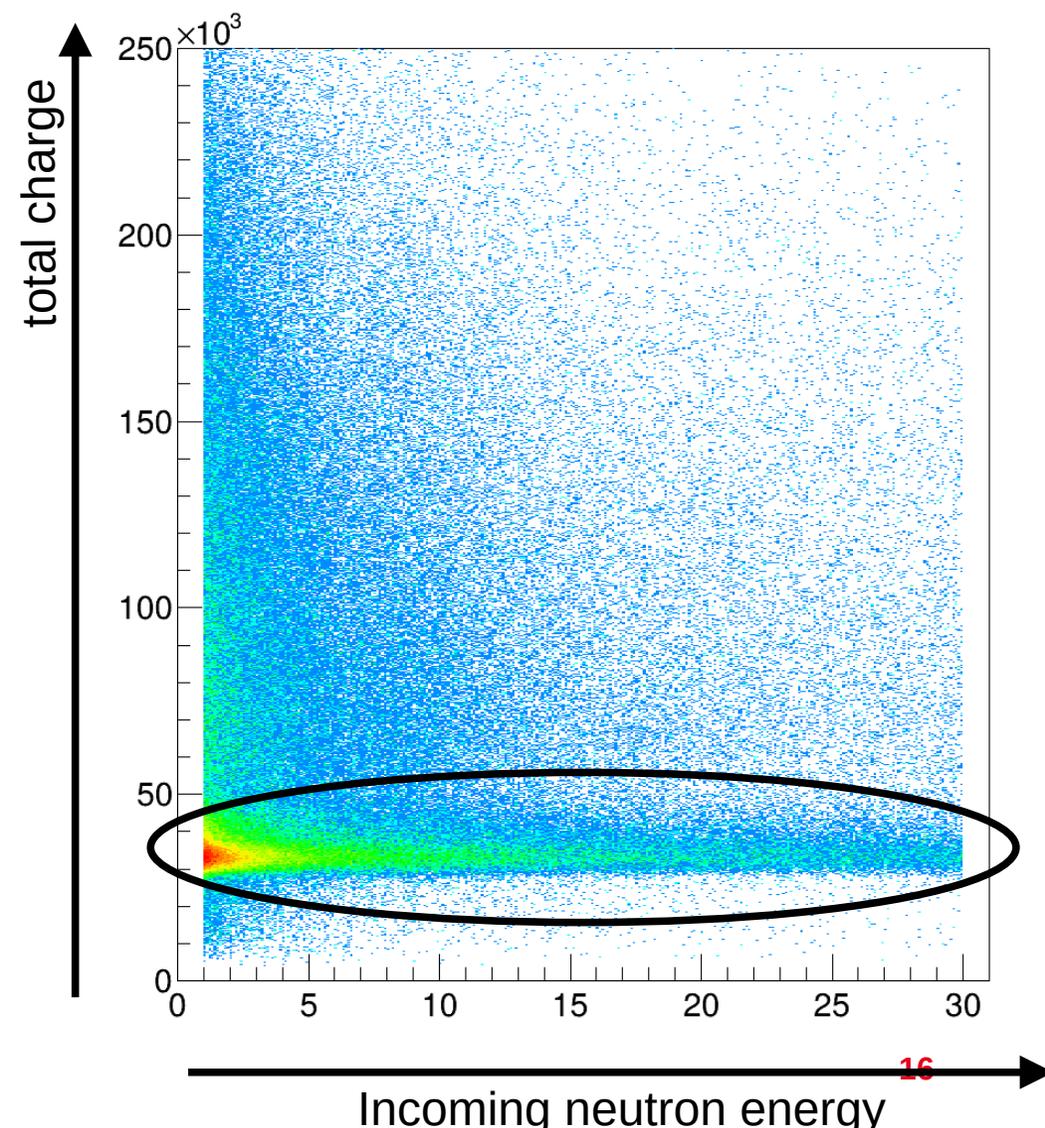

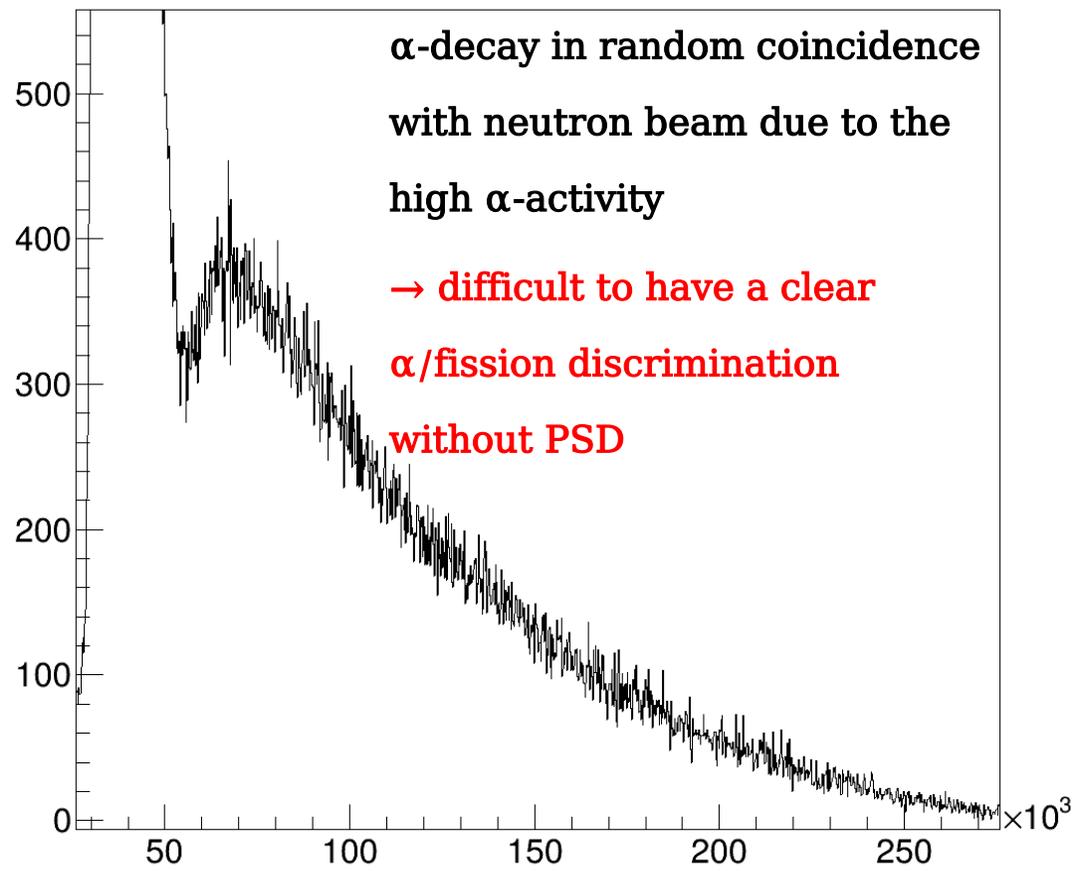

# $\alpha$ and fission charge spectra (I)

$^{238}\text{U}$  easy case, former PA, no need of PSD

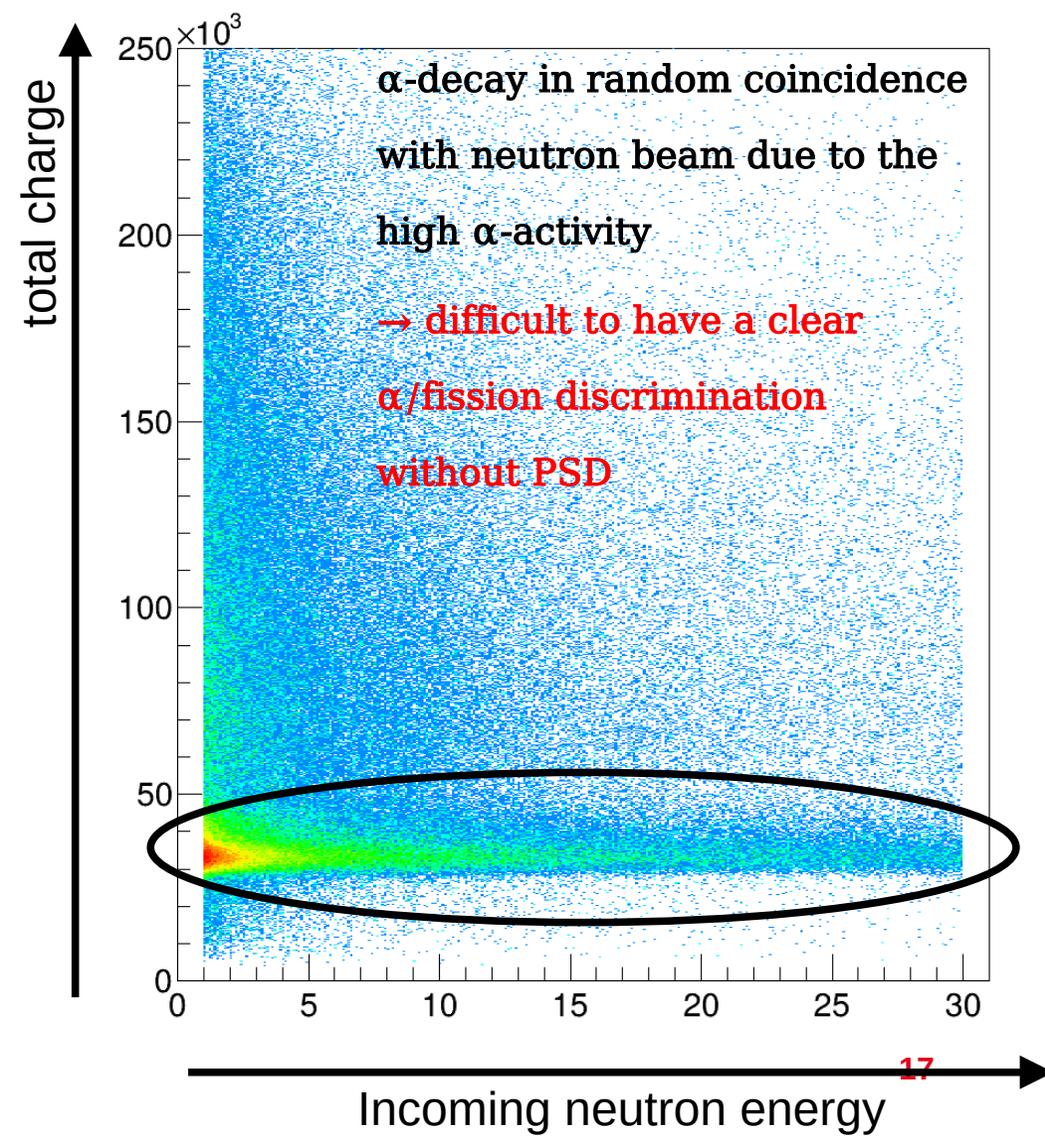

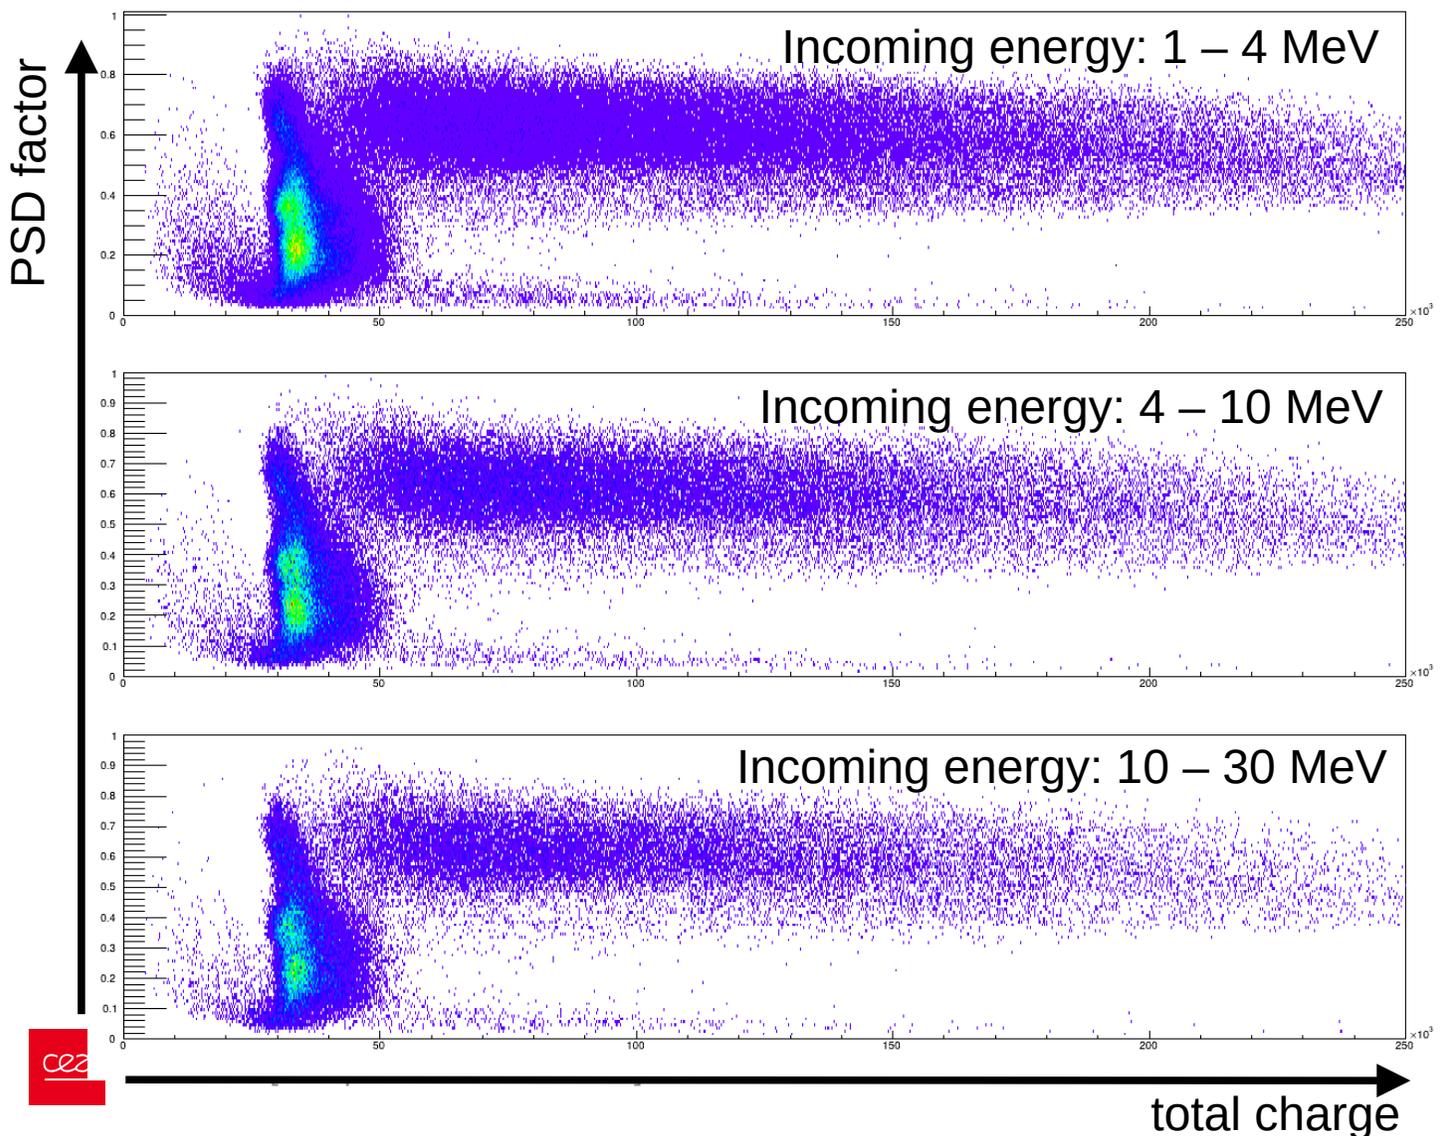

# $\alpha$ and fission charge spectra (II)

$^{240}\text{Pu}$  case @ 10 MBq / channel

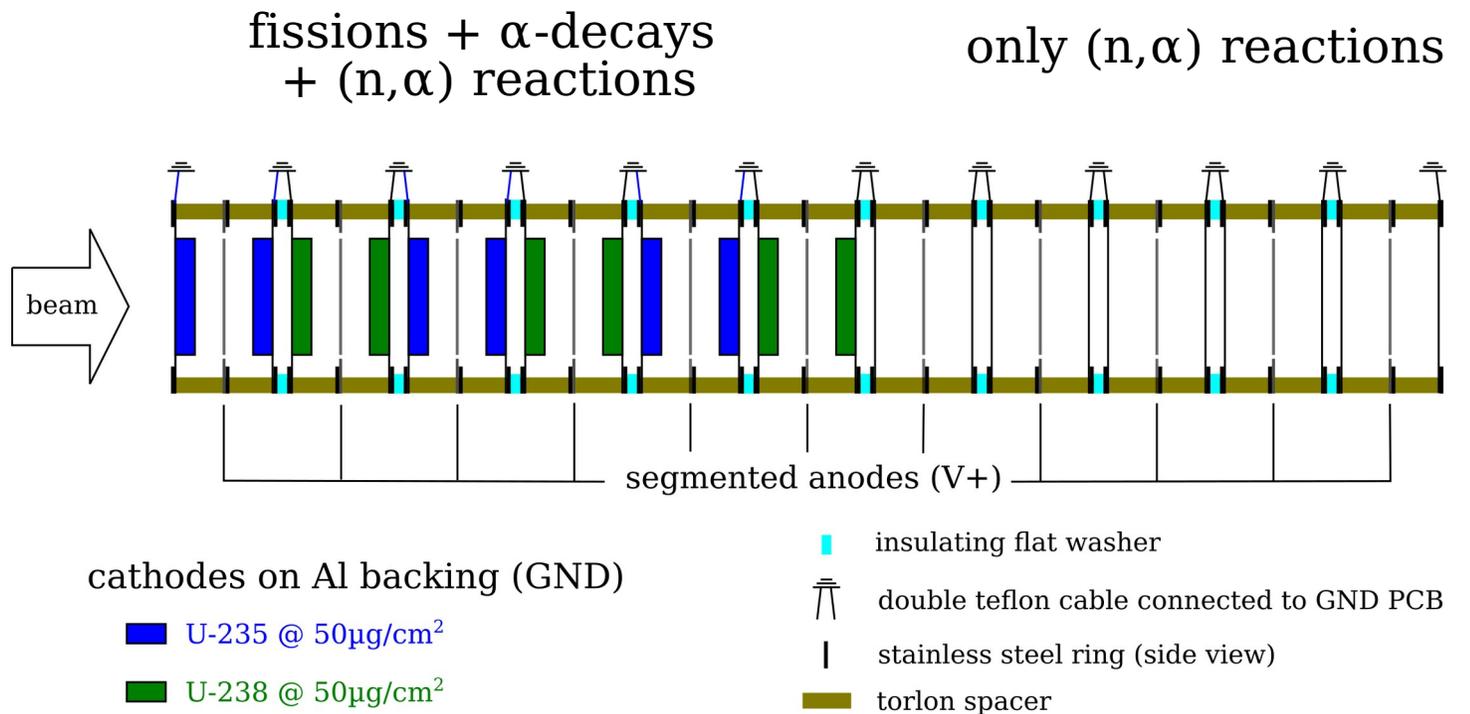

# $\alpha$ and fission charge spectra (II)

$^{240}\text{Pu}$  case @ 10 MBq / channel, [PSD analysis with new PA](#)

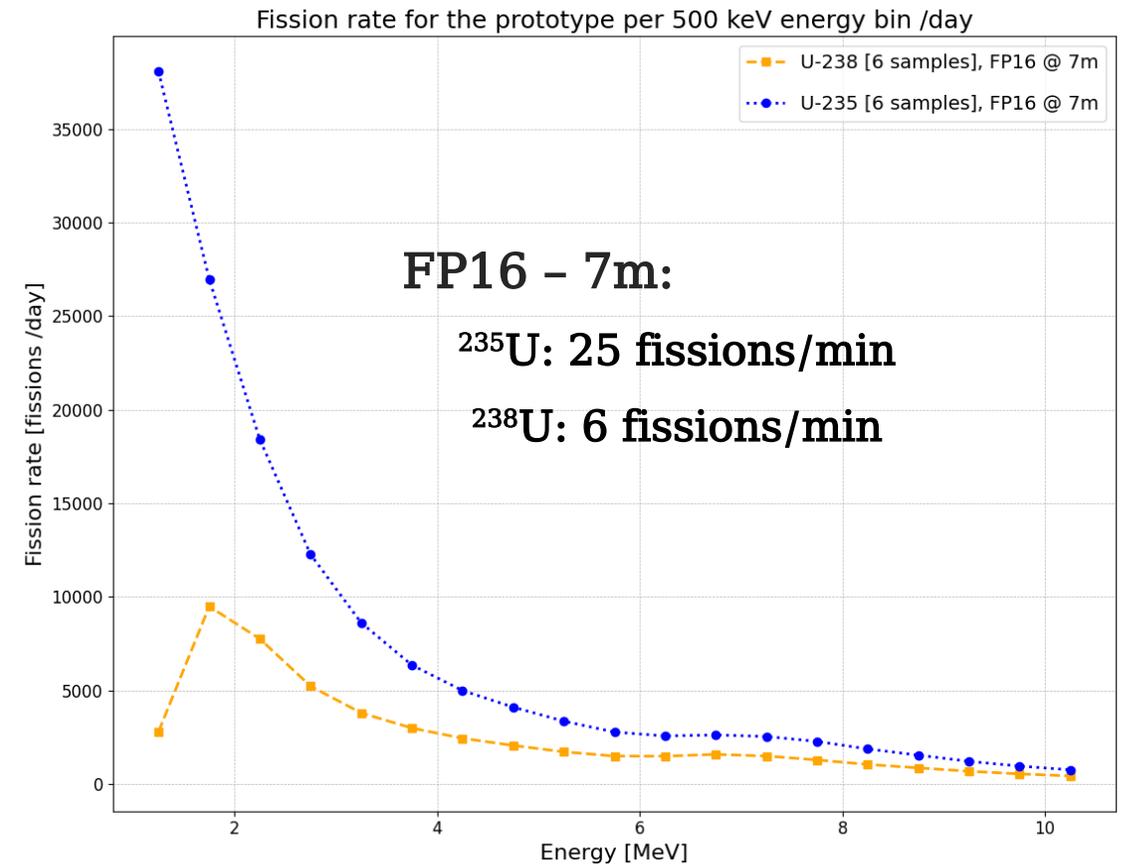

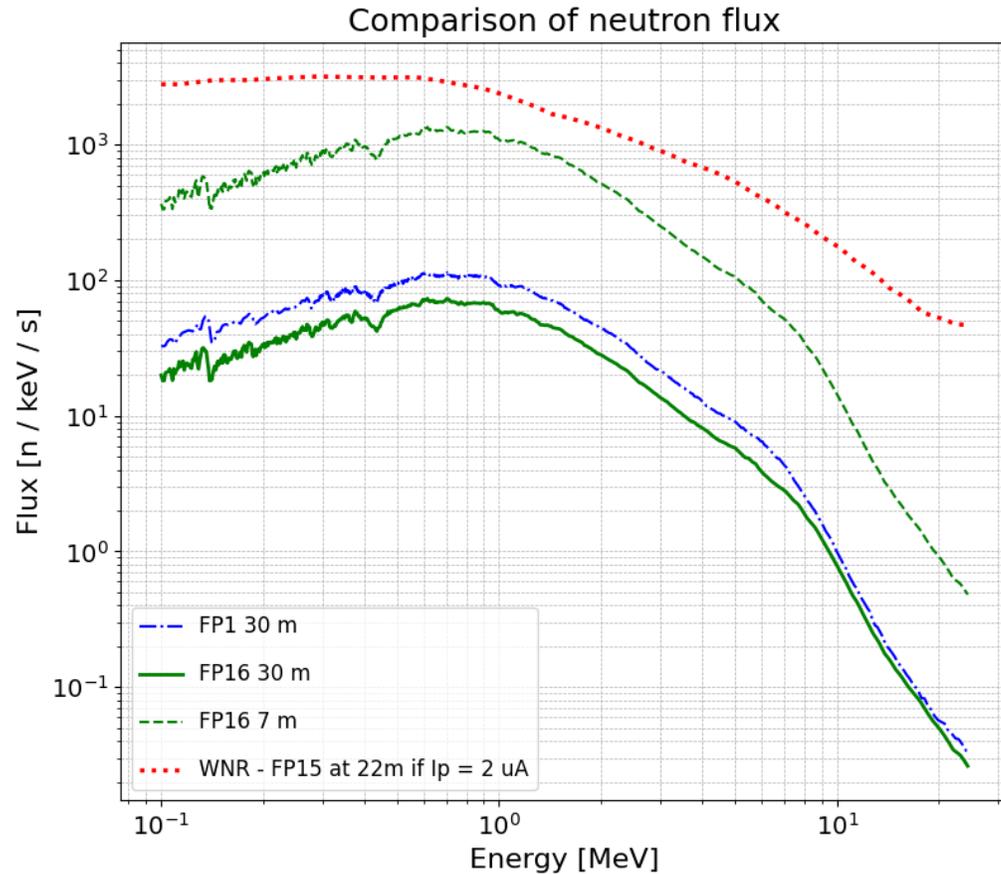

# Second in-beam test at GELINA with fast neutrons

EPIC fission chamber with new PA, thin  $^{235,238}\text{U}$  samples at different gas pressures

# Second in-beam test at GELINA with fast neutrons

On [FP16 - 7m](#) (thanks to Maelle *et al.* and the GELINA team)

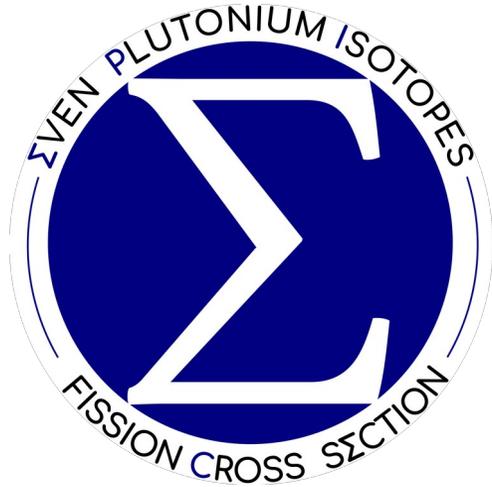

# 3 ■ Conclusions

# EPIC milestones planning

All  $^{235,238}\text{U}$  and  $^{242,240}\text{Pu}$  targets are ready at JRC-Geel

Possible additional experiments  
at TUNL/GELINA/MONNET

- First test in parasitic mode: **in-beam test in 12-16 November 2025 @LANL**
  - Chamber with  $^{238}\text{U}$ ,  $^{235}\text{U}$  @  $250 \mu\text{g}/\text{cm}^2$  : new mechanics and existing thick samples
  - Chamber with  $^{240}\text{Pu}$  @  $50 \mu\text{g}/\text{cm}^2$  samples (thin), and equipped with new high bandwidth PA
- First test in parasitic mode: **in-beam test in June 2026 @GELINA**
  - Chamber with  $^{238}\text{U}$ ,  $^{235}\text{U}$  @  $50 \mu\text{g}/\text{cm}^2$  : new mechanics, new high bandwidth PA
- Start with two "easier" cases from high priority request list
  - $^{242}\text{Pu}(n,f) / ^{235}\text{U}(n,f) : T_{1/2} = 3.75 \text{ E5 y}$  [**accepted, experiment in 2026**]
  - $^{240}\text{Pu}(n,f) / ^{235}\text{U}(n,f) : T_{1/2} = 6561 \text{ y}$  [**targets available, experiment forseen in 2027**]
- GOAL : challenging measurement due to the very high alpha activity
  - $^{238}\text{Pu}(n,f) / ^{235}\text{U}(n,f) : T_{1/2} = 82.5 \text{ y}$  [**experiment expected in 2028 (?)**]

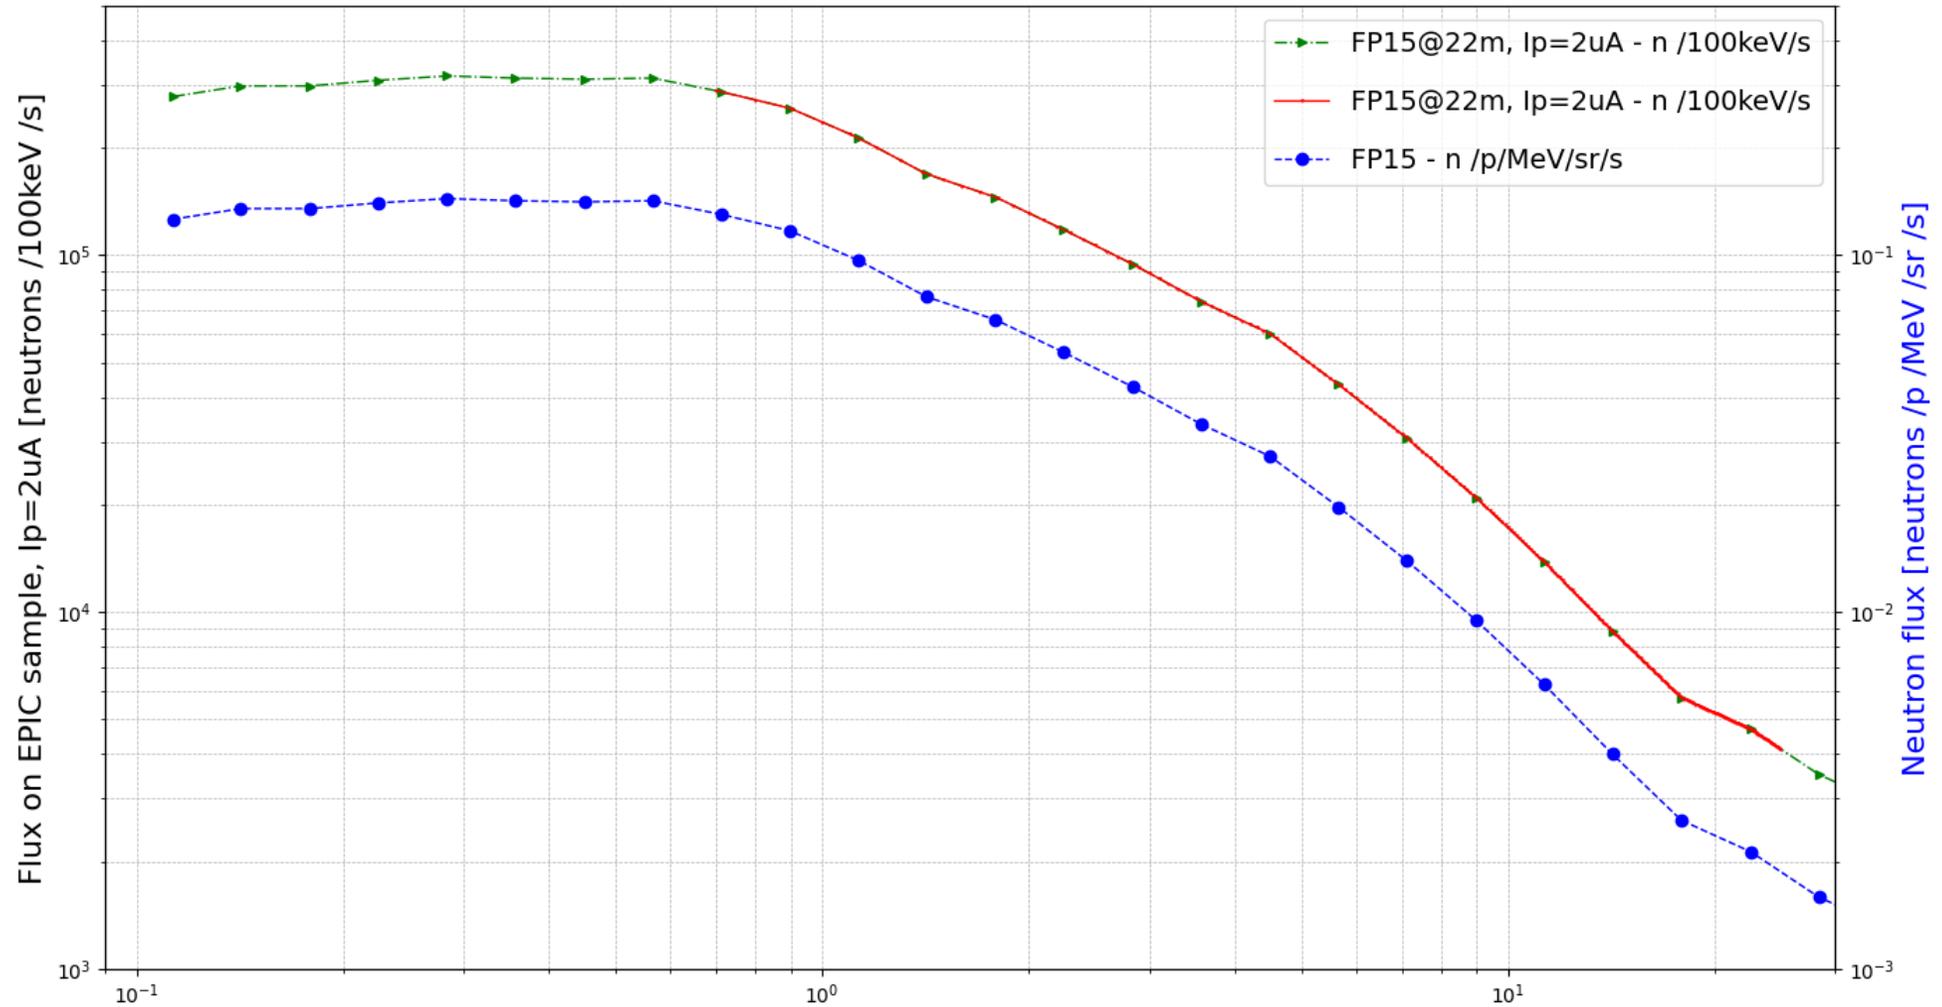

THANK YOU FOR YOUR ATTENTION
