Bridge Lab Symposium For Laser Acceleration

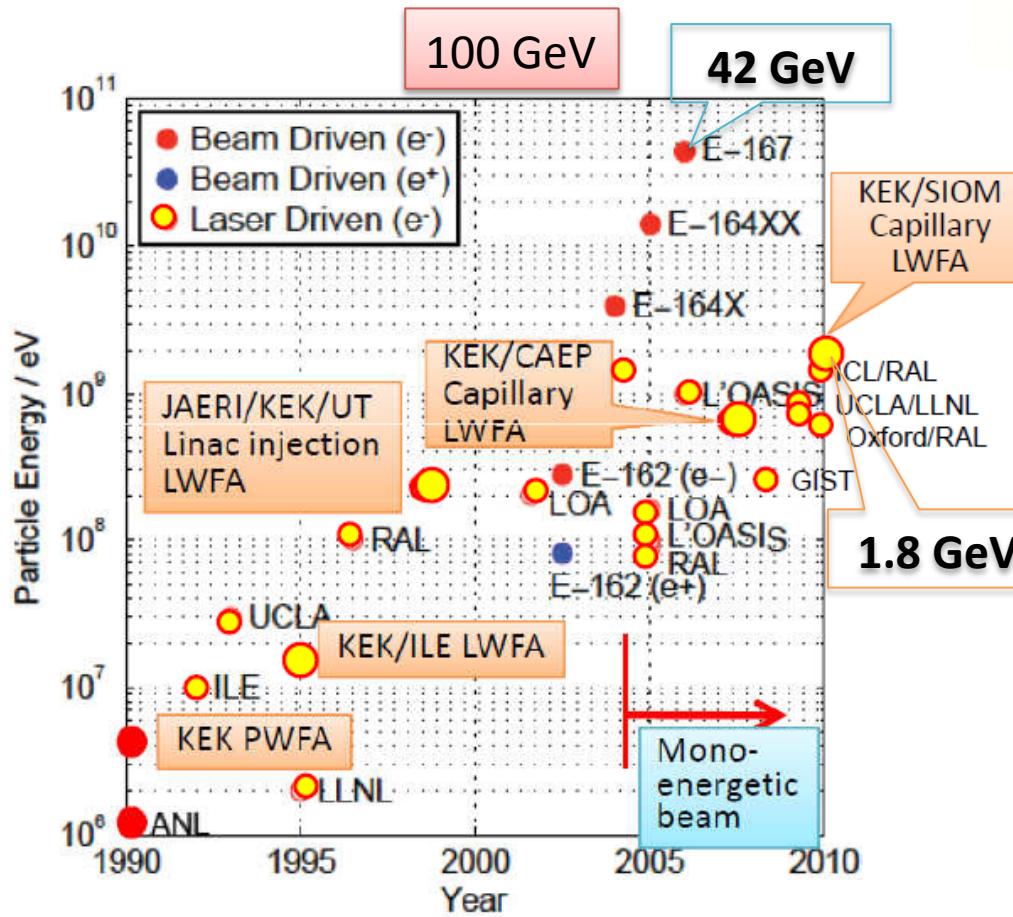

Route Toward Reality

January 14, 2011, Paris-France

Outline

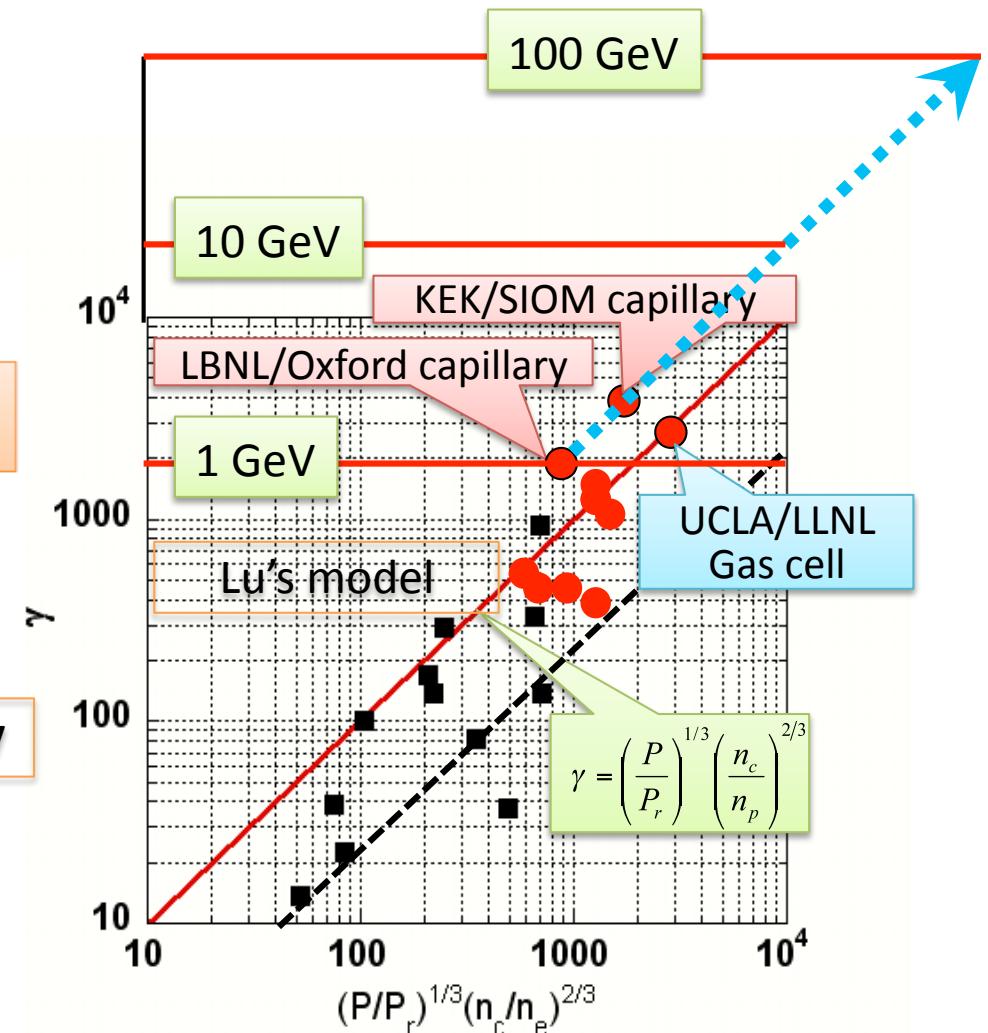

- Worldwide experimental progress and energy scaling
- Design of LWFA toward 100 GeV
- Positron production and acceleration by laser
- Long plasma channel generation at kHz rep rate
- Plasma channel coupler for staging
- Design of 10 – 100 GeV beam diagnostics
- Resonant LWFA at kHz rep rate

Evolution of the maximum electron energy by single-stage laser-plasma accelerators since 1990

M.J. Hogan, AAC2010

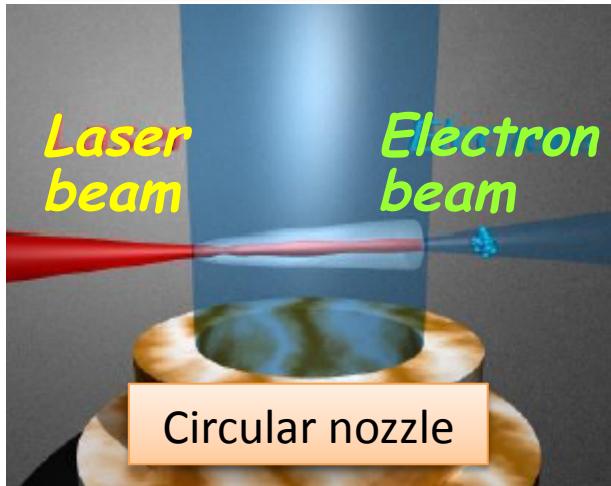

Energy gain scaling of LWFA

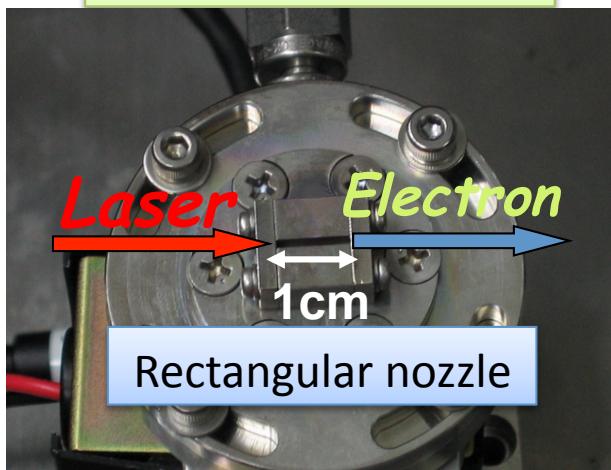

Plasma channel enhances energy gain by a factor of 2

Plasma Accelerators lower than 10 GeV

Millimeter-scale plasma

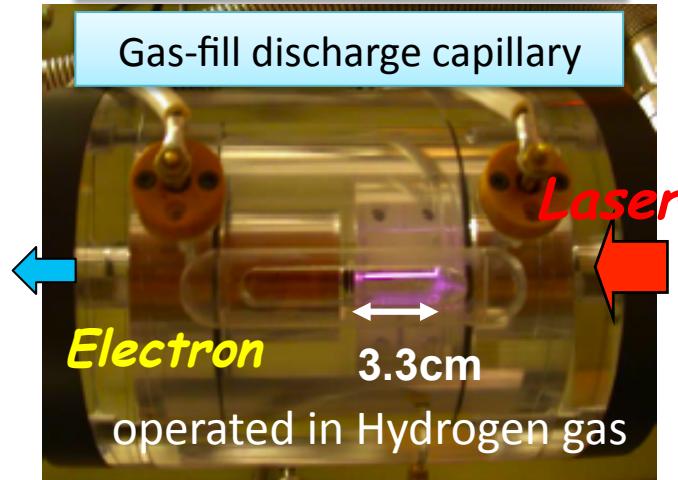

Super-sonic gas jet

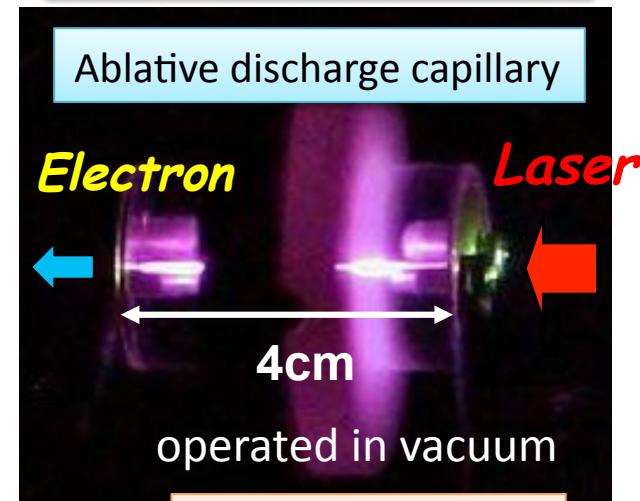

Self-guiding plasma channel

Centimeter-scale plasma

Capillary plasma channel

Pre-formed plasma channel

Higher than 10 GeV

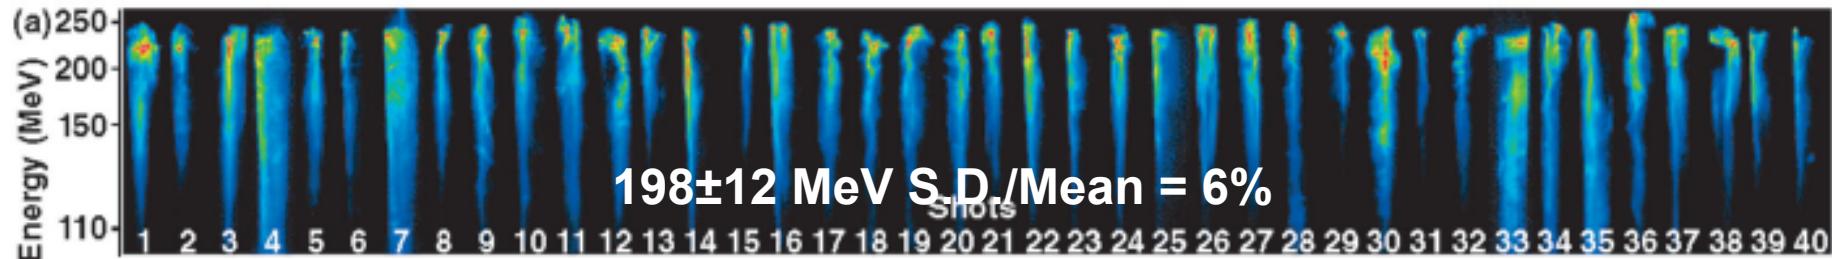

Meter-scale plasma

- How to produce a long scale plasma?
- Self-guiding or pre-formed plasma channel?
- How to make staging? should be answered.

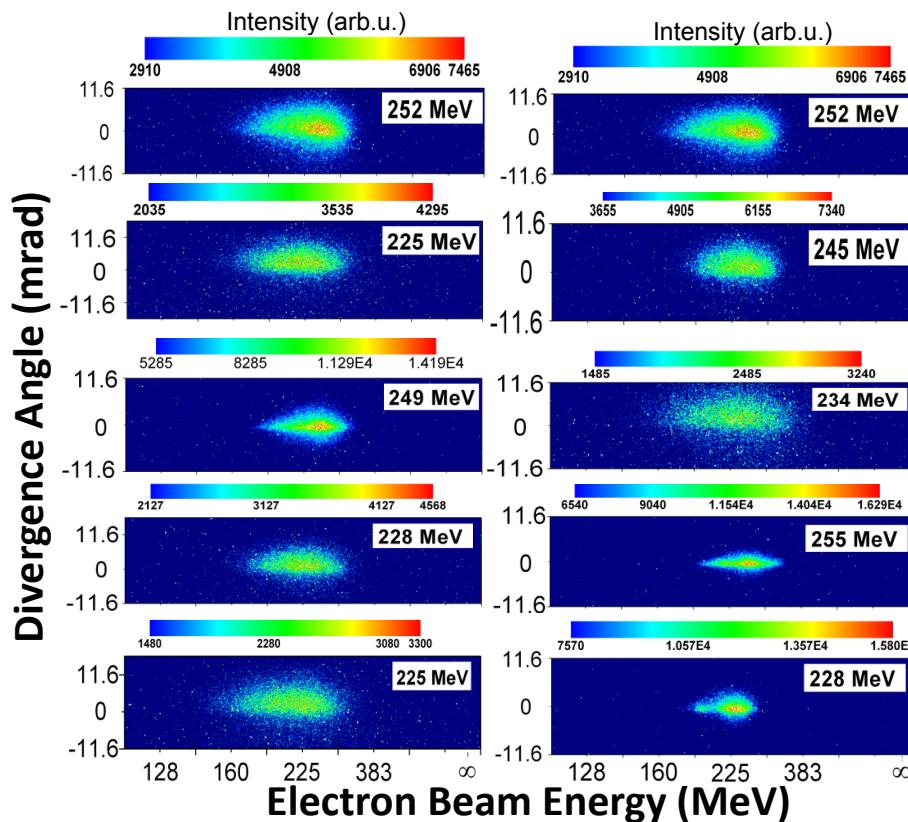

Stability in self-injection is as high as laser stability

Laser: P = 20TW 42fs FWHM, Intensity: $1.7 \times 10^{18} \text{ W/cm}^2$ ($a_0=0.89$), $n_e=7.8 \times 10^{18} \text{ cm}^{-3}$

A steady-state-flow gas-fill capillary experiment at MPQ, Germany

J. Osterhoff et al., PRL 101, 085002 (2008)

1 cm gas jet experiment
at GIST-APRI, Korea

Mean laser power 37TW, 35fs
SD/Mean pulse energy = 4.6%
 $n_e \sim 7 \times 10^{18} \text{ cm}^{-3}$

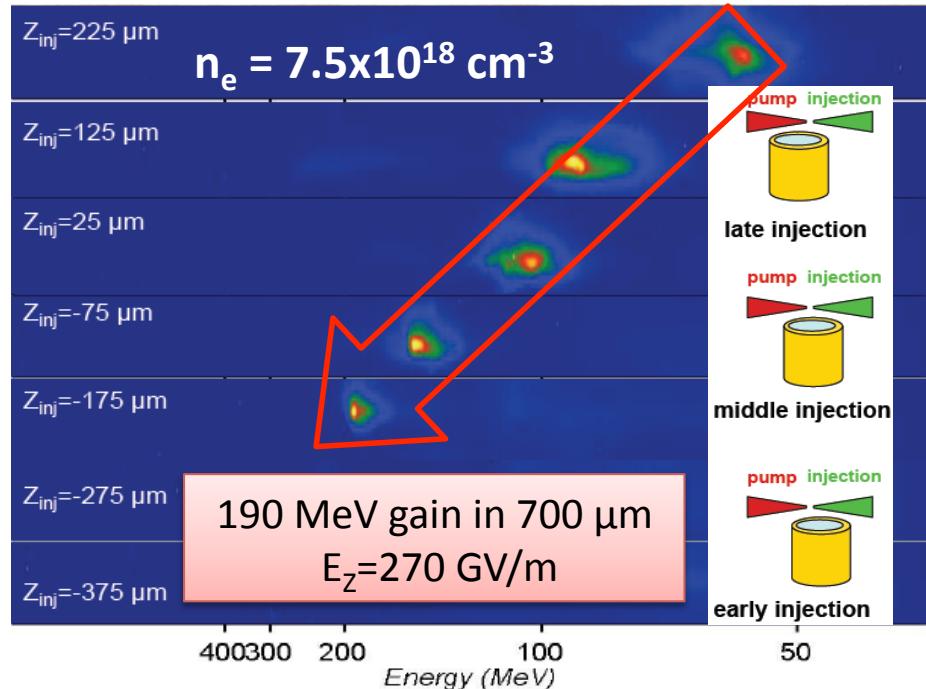

Mean electron energy = 236.9 MeV
SD/Mean E = 5 %; Charge: ~100pC
Divergence angle: ~a few mrad

110 TW 60 fs $a_0 = 3.8$, $n_e = 1.3 \times 10^{18} \text{ cm}^{-3}$

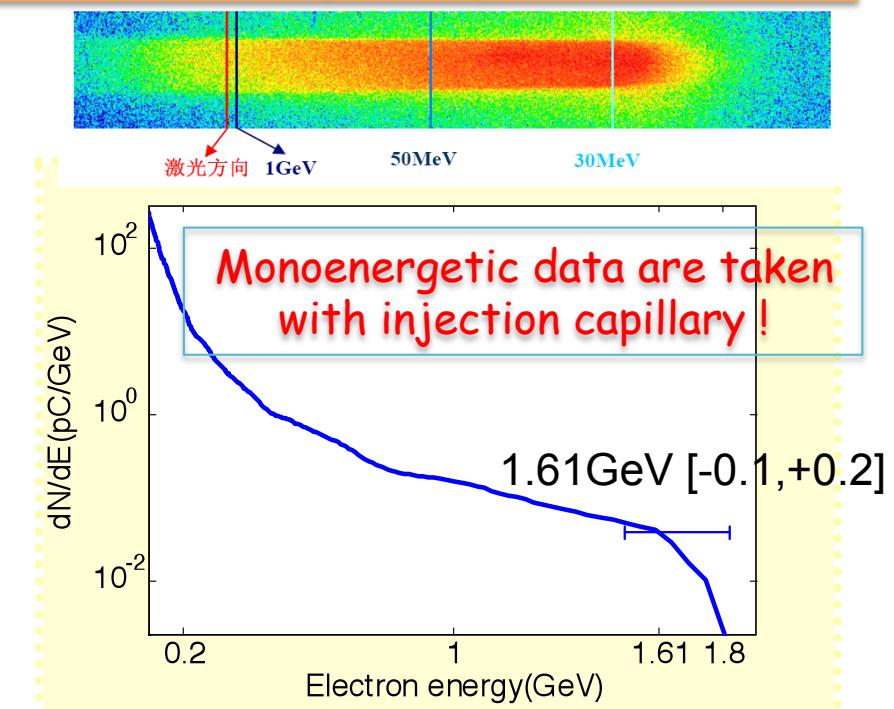

Capillary boosts LWFA up to near 2 GeV

J. S. Liu et al., CCAST-WL Workshop on Strong Field Laser Physics, Shanghai, Oct.10-29 (2010)

72 TW 50 fs $a_0 = 2.9$ $n_e = 2.1 \times 10^{18} \text{ cm}^{-3}$

What is the optimum plasma density?

The electron plasma frequency: $\omega_p = \sqrt{\frac{4\pi e^2 n_0}{m_e}} = \frac{2\pi c}{\lambda_p}$

- Plasma electron density n_0 corresponds to frequency of RF cavity, which characterizes accelerator performance .
- Minimizing the overall length of LPA linac

$$L_{total} = [L_{stage} + L_c] \frac{E_b}{W_{stage}}$$

E_b : the final beam energy

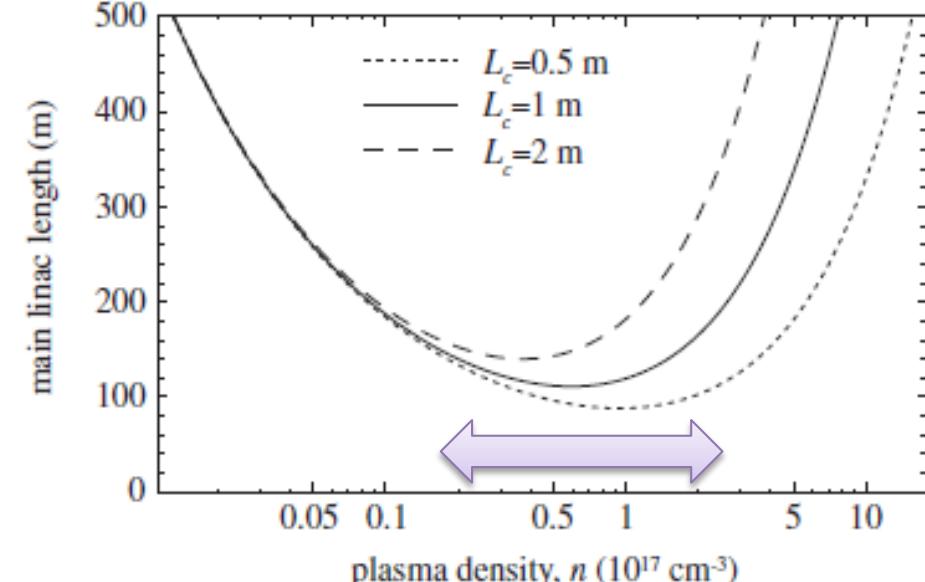

W_{stage} : the energy gain in a single stage

L_{stage} : the single stage plasma length

L_c : the required coupling distance

$$W_{stage} \propto E_z L_d \propto n_0^{-1} \quad L_{stage} \approx L_{pd} \propto n_0^{-3/2}$$

For $E_b = 0.5$ TeV, $a_0 = 1.5$,
coupling distance $L_c \lesssim 1$ m

C. B. Schroeder et al., PRST-AB 13, 101301 (2010)

The required operation plasma density $\approx 10^{17} \text{ cm}^{-3}$

- With minimization condition $L_c \sim L_{stage} \approx L_{pd}$

$$L_{total} \propto L_{pd} N_{stage} \propto n_0^{-1/2}$$

- Plasma density is continuously tunable over the broad range.
- Plasma accelerator structure is not so expensive.

Selection of plasma density is not a big issue.

Plasma density could be determined by beam quality and power requirement

Radiation damping effect

- Electrons accelerated by LPA undergo betatron oscillations due to strong focusing force
- Emission of synchrotron radiation results in energy loss and radiation damping with its rate.

$$P_x \cong \frac{2e^2\gamma^2}{3m^2c^3} F_\perp^2 \quad \nu_\gamma = \frac{P_s}{\gamma mc^2} = \frac{\tau_R \gamma}{m^2 c^2} F_\perp^2$$

where $\tau_R = 2r_e/3c \cong 6.26 \times 10^{-24}$ s

$$r_e = e^2/mc^2 = 2.818 \times 10^{-13}$$
 cm

$$F_\perp = -mc^2 K^2 x$$

$$K^2 = 2x_c^{-2} (e\phi_0/mc^2),$$

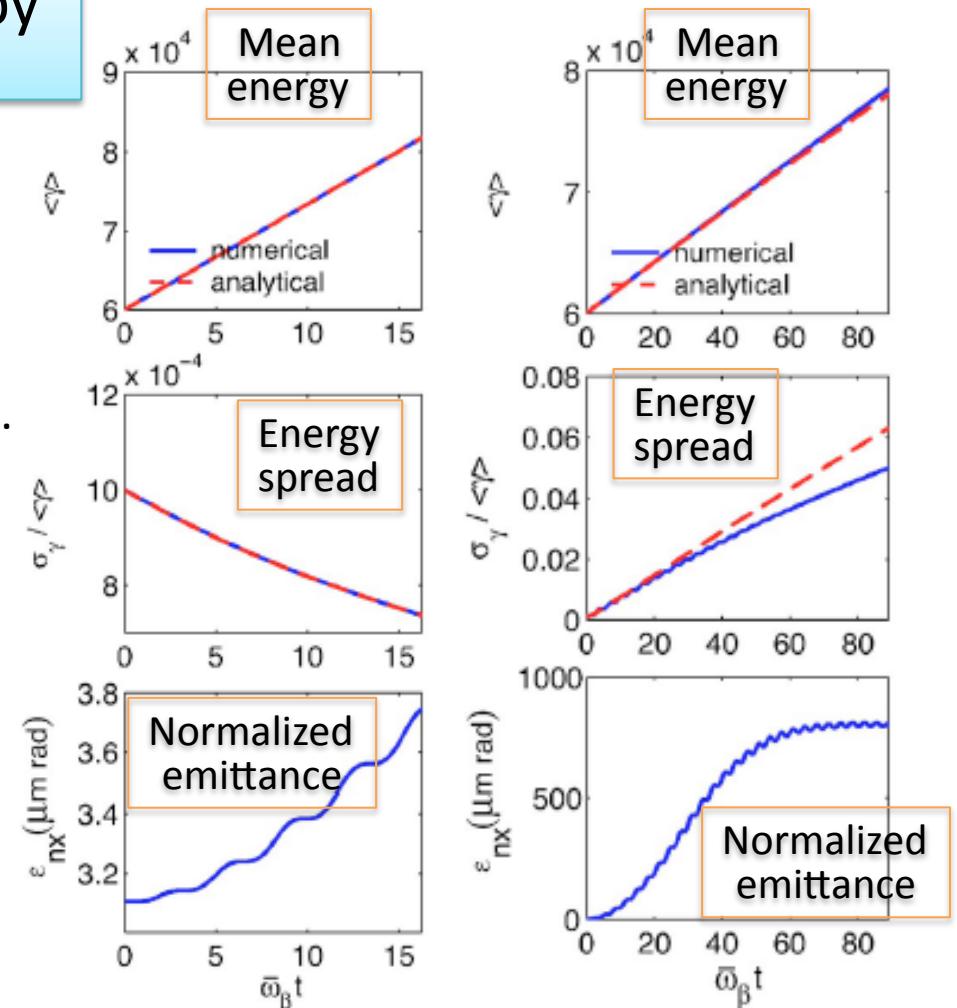

$$K = k_p / \sqrt{2}$$

for the linear regime
with potential ϕ_0 ,
characteristic channel
width x_c

for the blowout (or bubble) regime

Power requirement for the linear collider

- Collision frequency: $f \propto N^{-2} \propto n_0$
for a constant required luminosity
- Beam power: $P_b = f N E_b \propto n_0^{1/2}$
- Average laser power per stage: $P_{avg} \cong f U_L \sim f \cdot P_L \tau_L$
 $\propto n_0 \cdot n_0^{-1} \cdot n_0^{-1/2} \propto n_0^{-1/2}$
- Total wall plug power $P_{wall} \propto N_{stage} P_{avg} \propto n_0^{1/2}$

30 GeV injection
30 cm plasma channel
 $E_z = 37$ GV/m
 $n_0 = 10^{16}$ cm $^{-3}$

30 GeV injection
30 cm plasma channel
 $E_z = 37$ GV/m
 $n_0 = 3 \times 10^{17}$ cm $^{-3}$

From points of high quality and power cost,
choose plasma density of the order of
 10^{16} cm $^{-3}$

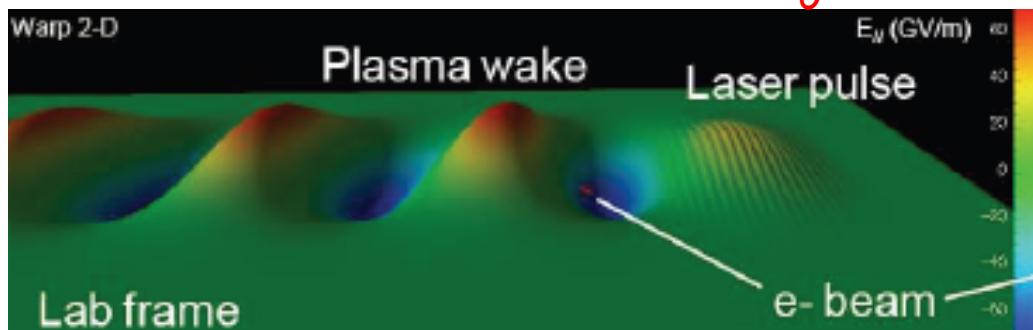

Linear wake or Nonlinear wake ?

Normalized vector potential of laser intensity

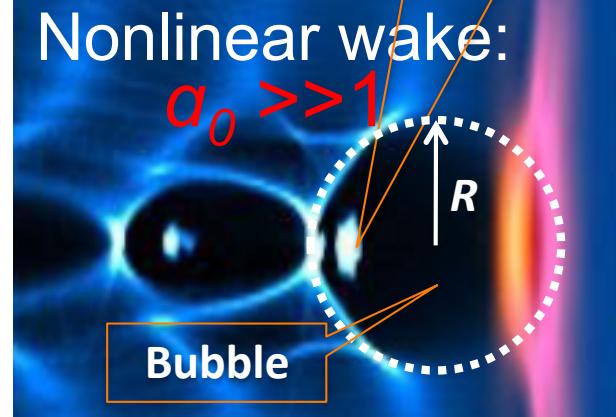

$$a_0 = \left(\frac{2e^2 \lambda_0^2 I}{\pi m_e^2 c^5} \right)^{1/2} \cong 0.855 \times 10^{-9} I^{1/2} [\text{W/cm}^2] \lambda_0 [\mu\text{m}]$$

Self-injected electrons

Linear wake: $a_0 \lesssim 1$

C.G.R. Geddes, LPAW2009

W. Lu, PRST-AB 10, 061301 (2007)

$$\Delta W_{\text{linear}} \approx 1.3 mc^2 a_0^2 \frac{n_c}{n}$$

$$\Delta W_{\text{linear}} [\text{GeV}] \approx 35 \frac{P[\text{TW}]}{r_0^2 [\mu\text{m}]} \left(\frac{10^{18}}{n_p [\text{cm}^{-3}]} \right)$$

for $\lambda = 0.8 \mu\text{m}$

For $P = 1 \text{ PW}$, $\tau_L = 130 \text{ fs}$, $U_L = 130 \text{ J}$

$r_0 = 172 \mu\text{m}$, $a_0 = 1$, $n_p = 1 \times 10^{17} \text{ cm}^{-3}$

$$\Delta W_{\text{linear}} \approx 12 \text{ GeV at } L_{\text{acc}} = 1.8 \text{ m}$$

Avoid self-injection of electrons

$$\Delta W \approx \frac{2}{3} mc^2 a_0 \frac{n_c}{n_p}$$

$$\Delta W [\text{GeV}] \approx 0.36 (P[\text{TW}])^{1/3} \left(\frac{10^{18}}{n_p [\text{cm}^{-3}]} \right)^{2/3}$$

for $\lambda = 0.8 \mu\text{m}$

For $P = 1 \text{ PW}$, $\tau_L = 130 \text{ fs}$, $U_L = 130 \text{ J}$,

$r_0 = 58 \mu\text{m}$, $a_0 = 3$, $n_p = 1 \times 10^{17} \text{ cm}^{-3}$

$$\Delta W_{\text{linear}} \approx 17 \text{ GeV at } L_{\text{acc}} = 0.7 \text{ m}$$

Allow self-injection of electrons

Design of 10 GeV acceleration stage in the quasi-linear regime

$$a_0^2 \sim 1$$

1) Acceleration wakefield

For $k_p \sigma_z = 2/3$ σ_z :laser pulse duration

$$E_z [\text{GV/m}] \sim 0.3 \frac{a_0^2}{\sqrt{1+a_0^2/2}} \sqrt{\frac{n_0}{10^{14} \text{cm}^{-3}}}$$

2) Acceleration length

Dephasing length: $L_d \cong \lambda_p \frac{\omega_0^2}{\omega_p^2} = \lambda_p \frac{n_c}{n_0}$

Pump depletion length:

$$k_p L_{pd} \cong \frac{8}{\sqrt{\pi}} \frac{\omega_0^2}{\omega_p^2} \frac{1}{a_0^2 k_p \sigma_z} \exp\left(\frac{k_p^2 \sigma_z^2}{2}\right) = \frac{8.5}{a_0^2} \frac{n_c}{n_0}$$

3) Energy gain

$$\Delta W \approx e E_z L_{acc} \cong 0.2 mc^2 \frac{a_0^2}{\sqrt{1+a_0^2/2}} \frac{n_c}{n_0}$$

$$\Delta W [\text{GeV}] \approx 0.18 \frac{a_0^2}{\sqrt{1+a_0^2/2}} \left(\frac{10^{18} \text{cm}^{-3}}{n_0} \right) \left(\frac{0.8 \mu\text{m}}{\lambda_0} \right)^2$$

Design of 10 GeV electron injector in the weakly nonlinear regime

$$a_0 \geq 2$$

For $k_p R \approx k_p r_L \approx 2\sqrt{a_0}$ R : Bubble radius
 r_L :laser spot radius

$$E_{z\max} \sim \sqrt{a_0} \frac{mc\omega_p}{e} \approx 96 [\text{GV/m}] \sqrt{\frac{a_0 n_0}{10^{18} \text{cm}^{-3}}}$$

Dephasing length:

$$k_p L_d \cong \frac{2}{3} \frac{\omega_0^2}{\omega_p^2} k_p R \approx \frac{4}{3} \sqrt{a_0} \frac{n_c}{n_0} \quad L_d \cong \frac{2\sqrt{a_0}}{3\pi} \lambda_p \frac{n_c}{n_0}$$

Etching distance:

The laser etches back due to local pump depletion.

$$L_{etch} \cong \frac{\omega_0^2}{\omega_p^2} c \tau_L = c \tau_L \frac{n_c}{n_0}$$

$$L_{etch} \geq L_d \Rightarrow c \tau_L \geq \frac{2}{3} R \approx \frac{2\sqrt{a_0}}{3\pi} \lambda_p$$

$$\Delta W \approx e E_z L_d \cong \frac{4}{3} mc^2 a_0 \frac{n_c}{n_0}$$

$$\Delta W [\text{GeV}] \approx 1.2 a_0 \left(\frac{10^{18} \text{cm}^{-3}}{n_0} \right) \left(\frac{0.8 \mu\text{m}}{\lambda_0} \right)^2$$

The quasi-linear regime

4) Spot size

To avoid bubble formation

$$\frac{k_p^2 r_L^2}{4} \geq \frac{a^2}{\sqrt{1+a^2/2}} \Rightarrow k_p r_L \geq 2 \text{ for } a_0 \sim 1$$

To avoid self-focusing

$$\frac{P}{P_c} = \frac{k_p^2 r_L^2 a_0^2}{32} \leq 1 \Rightarrow k_p r_L \leq 6 \text{ for } a_0 \sim 1$$

5) Power and energy requirement

$$P[\text{TW}] = \frac{a_0^2}{30} \left(\frac{r_L}{1\mu\text{m}} \right)^2 \left(\frac{0.8\mu\text{m}}{\lambda_0} \right)^2 \quad E_L[\text{J}] = P[\text{TW}] \tau_L[\text{ps}]$$

6) The maximum number of accelerated charge

For 100 % beam-loading efficiency with 100% energy spread,

$$N_{\max} \approx \left(\frac{n_0}{4\pi r_e} \right)^{1/2} \frac{eE_0}{mc\omega_p} A \quad A \approx \pi/k_p^2$$

$$\approx \frac{1}{32} \left(\frac{1}{r_e^3 n_0} \right)^{1/2} \frac{a_0^2}{\sqrt{1+a_0^2/2}} k_p \sigma_z \exp\left(-\frac{k_p^2 \sigma_z^2}{4}\right)$$

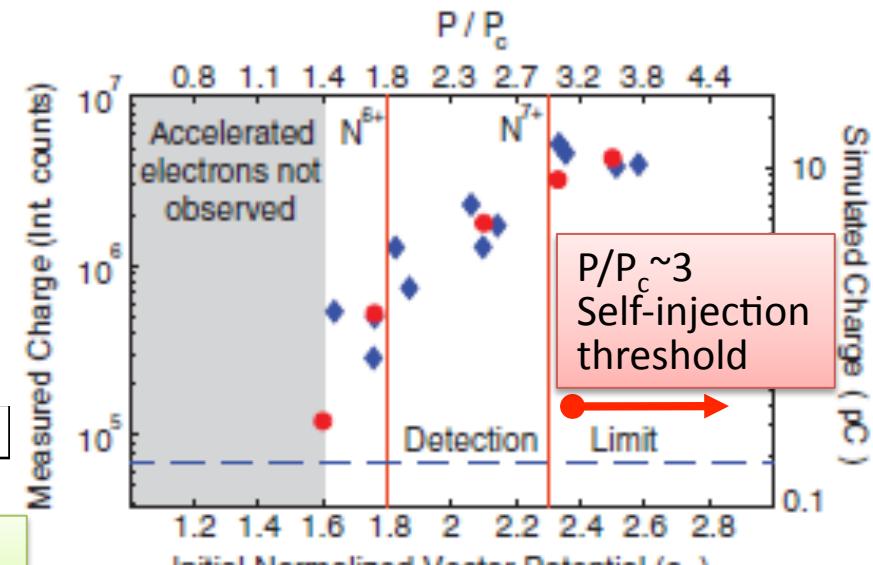

For $a_0 = 1, k_p \sigma_z = 2/3$

$$N_{\max} \approx 6.6 \times 10^9 \sqrt{\frac{10^{15}}{n_0 [\text{cm}^{-3}]}} \quad Q_{\max} [\text{nC}] \approx \sqrt{\frac{10^{15}}{n_0 [\text{cm}^{-3}]}}$$

The weakly nonlinear regime

$$k_p R \approx k_p r_L \approx 2\sqrt{a_0} \Rightarrow r_L = \frac{\lambda_p}{\pi} \sqrt{a_0}$$

Ionization induced injection needs $a_0 \gtrsim 2$

$n_e \sim 1.4 \times 10^{19} \text{ cm}^{-3}$; He:N₂ 9:1 gas mix

A. Pak et al., PRL 104.025003 (2010)

$$N_{\max} \approx \frac{8}{15k_0 r_e} \sqrt{\frac{e^2 P}{m^2 c^5}} \approx 2.5 \times 10^9 \frac{\lambda_0 [\mu\text{m}]}{0.8} \sqrt{\frac{P[\text{TW}]}{100}}$$

7) Plasma channel

- Matched radius:

$$r_M = \left(\frac{r_{ch}^2}{\pi r_e \Delta n} \right)^{1/4}$$

$$n(r) = n_0 + \Delta n \frac{r^2}{r_{ch}^2}$$

$$r_e = e^2 / mc^2$$

- Channel depth:

$$\Delta n = \frac{r_{ch}^2}{\pi r_e r_M^4}$$

$$\frac{\Delta n}{n_0} = \frac{4}{k_p^2 r_M^2} \left(\frac{r_{ch}}{r_M} \right)^2$$

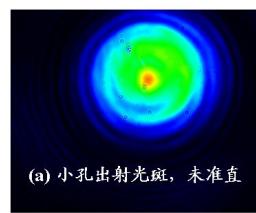

- Critical channel depth:

$$\Delta n_c = \frac{1}{\pi r_e r_L^2}$$

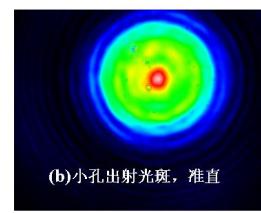

$$\frac{\Delta n_c}{n_0} = \frac{4}{k_p^2 r_L^2}$$

With $r_L = r_M$

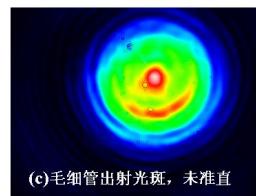

$$\frac{\Delta n}{n_0} = \frac{4}{k_p^2 r_L^2} \left(\frac{r_{ch}}{r_L} \right)^2$$

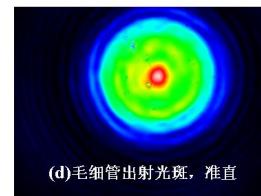

(a) 小孔出射光斑, 未准直

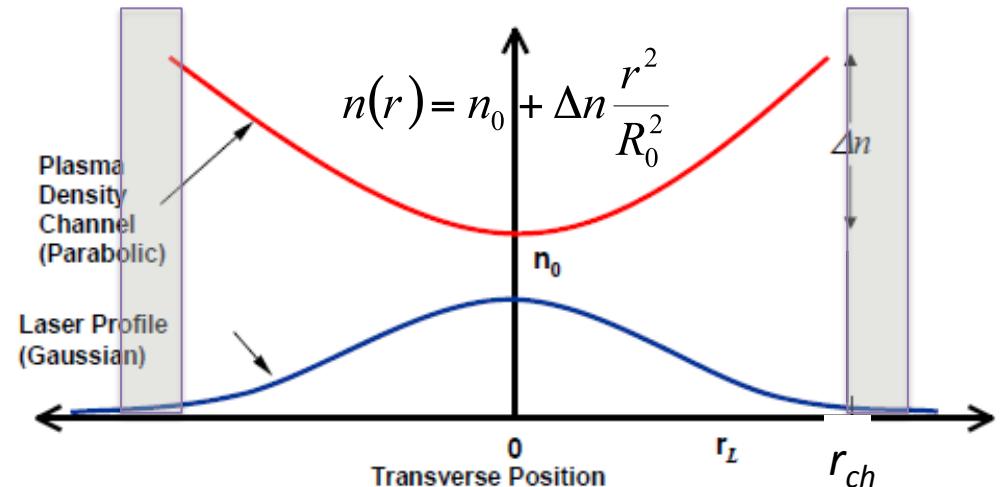

(b) 小孔出射光斑, 准直

(c) 毛细管出射光斑, 未准直

(d) 毛细管出射光斑, 准直

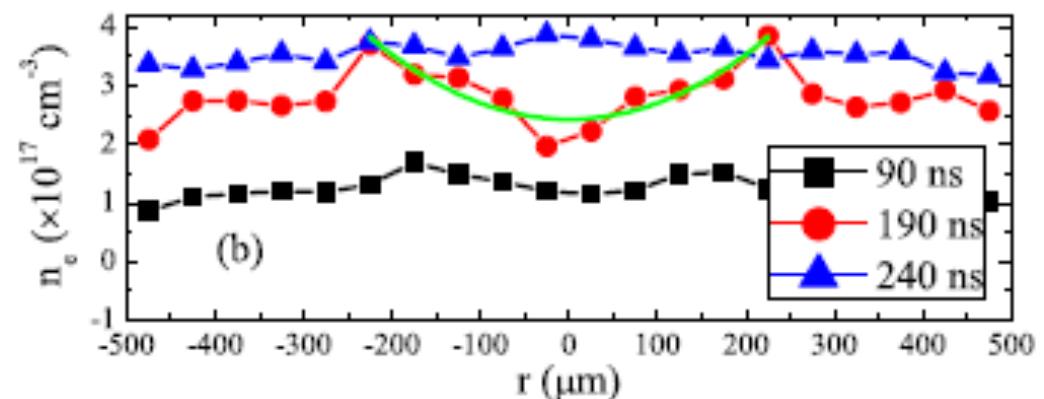

- Critical channel depth:

$$\frac{\Delta n_c}{n_0} = \frac{4}{k_p^2 r_L^2} \approx \frac{1}{a_0}$$

Ablative capillary with $r_{ch} = 0.5$ mm in the range of 10^{17} cm^{-3}

M. Liu et al., Rev. Sci. Instr. 81, 036107 (2010)

Positron injector by ultraintense short laser pulse

- Trident process in the nuclear field: $e + Z \rightarrow e' e^+ e^-$

- Threshold intensity for pair production

$$I_t = \frac{2.6 \times 10^{19}}{[\lambda_L(\mu\text{m})]^2} \text{ W/cm}^2 \quad \text{for} \quad E_i > 3m_e c^2$$

- The approximate cross section from H.J. Bhabha's formula

$$\sigma_T \approx 9.6 \times 10^{-4} (\alpha r_e Z)^2 (\bar{\gamma} - 3)^{3.6} \approx 9.6 \times 10^{-4} (\alpha r_e Z)^2 \bar{\gamma}^4$$

H.J. Bhabha, Proc. R. Soc. 152, 559, 1935

Shearer, J.W. et al., Phys. Rev. A8, 1582, 1973

- Assuming the electron energy accelerated by

laser radiation pressure as $\bar{\gamma} \approx \frac{1}{12} a_0^2 \frac{n_c}{n_0} \gg 3$

- The yield of pair production X. Q. Yan, 5th ASSS 2010

$$N_p \approx 5 \times 10^{-11} a_0^9 Z^3 \left(\frac{n_c}{n_0} \right)^2 \left(\frac{r_0}{\lambda} \right)^2 \left(\frac{\Delta}{\lambda} \right)^2$$

r_0 : the laser spot radius Δ : the plasma thickness

e.g.

$$Z = 54 (\text{Xe})$$

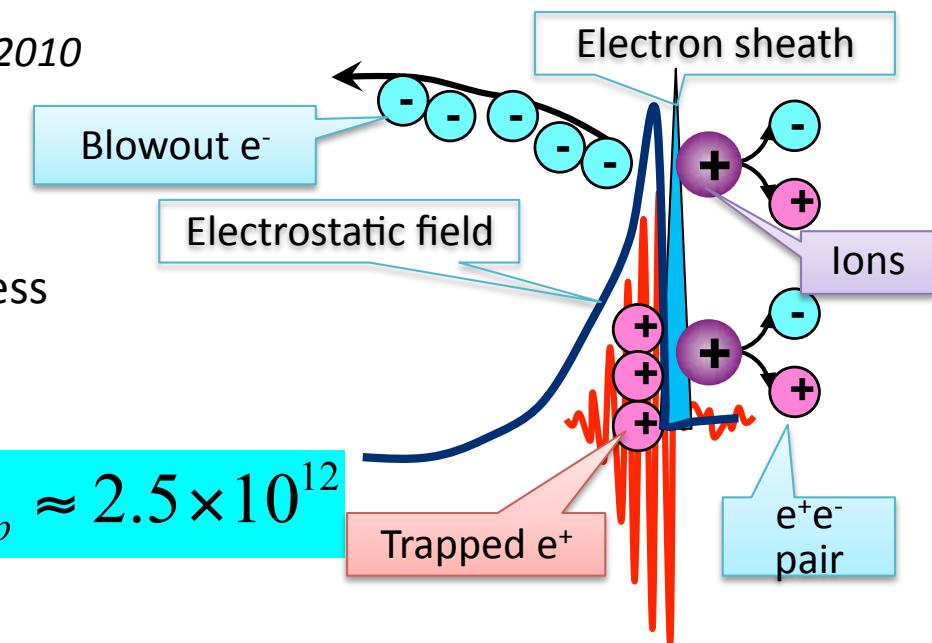

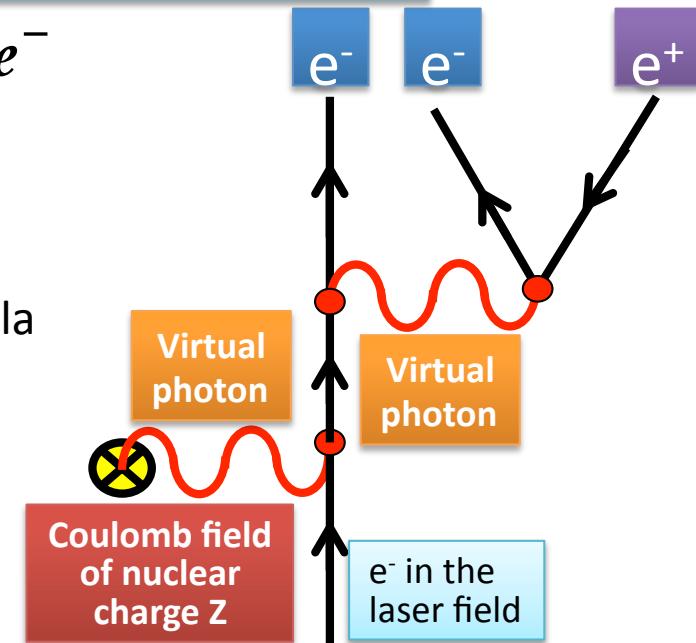

$$a_0 = 5.5 \quad (I = 6 \times 10^{19} \text{ W/cm}^2)$$

$$n_0 = 5 \times 10^{19} \text{ cm}^{-3}$$

$$r_0 = 10 \mu\text{m}$$

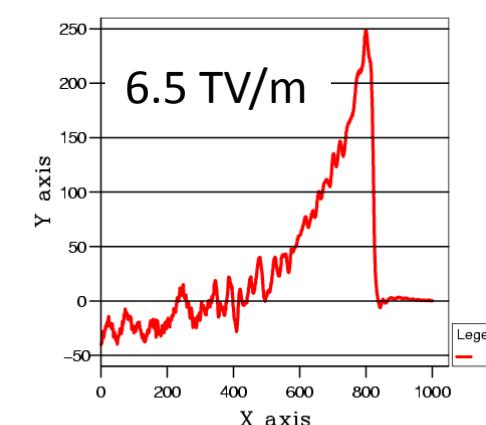

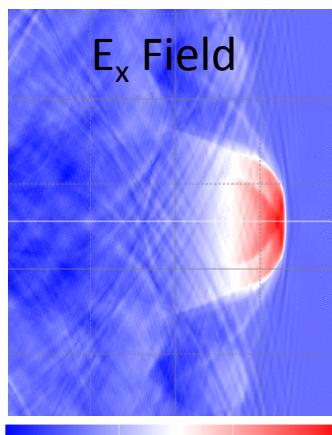

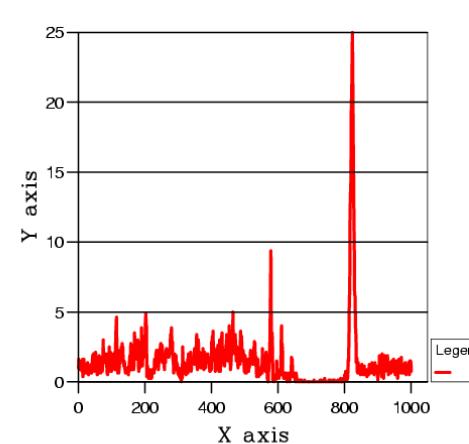

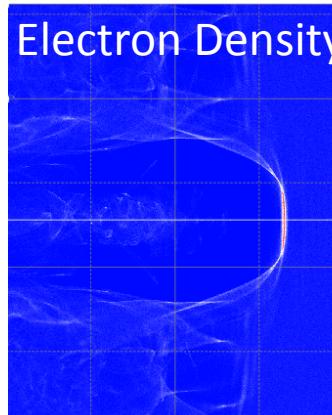

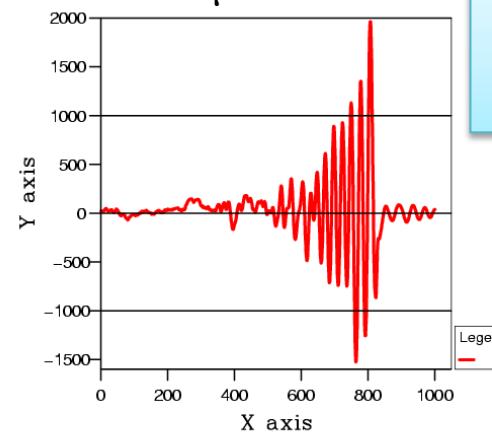

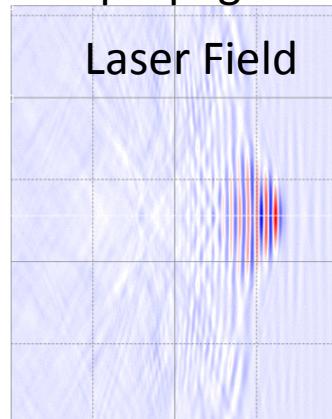

$$\Delta = 0.6 \text{ mm}$$

$$\lambda = 0.8 \mu\text{m}$$

$$N_p \approx 2.5 \times 10^{12}$$

At propagation distance 256 μ m

K. Nakajima et al., AIP Proc. 569, 97 (2001)

Solitary positive electrostatic field by asymmetric laser pulse

Peak power $P = 100 \text{ TW}$
 Pulse duration $\tau_p = 20 \text{ fs}$
 Spot radius $r_0 = 10 \mu\text{m}$
 Intensity $I_0 = 6 \times 10^{19} \text{ W/cm}^2$
 $a_0 = 5.5$
 Plasma density $n_0 = 5 \times 10^{19} \text{ cm}^{-3}$

$$n_e = \frac{n_0}{1 - \beta_x} \approx \frac{n_0}{1 - \beta_g} \Rightarrow \frac{n_e}{n_0} \approx \frac{1}{1 - \beta_g}$$

$$\beta_g = \sqrt{1 - \frac{n_0}{n_c}} \approx 0.986$$

$$n_e \approx 3.6 \times 10^{21} \text{ cm}^{-3}$$

As a result of strong self-focusing

$$E_{\max} \approx \sqrt{n_e [\text{cm}^{-3}]} \text{ eV} \approx 6 \text{ TV/m}$$

Pump depletion length $\sim 0.6 \text{ mm}$

e^+ energy gain $\sim 1.8 \text{ GeV}$

Design of multi-stage LWFA toward 100 GeV

	Electron Injector	Positron Injector	10 GeV stage	100 GeV stage	Multi-stage 100 GeV	LBNL- BELLA 10 GeV

Drive laser pulse

100 kHz operation is possible !

T. Shoji, Univ. Nagoya

Preliminary test of a long-range plasma channel generated by RF discharge

Staging needs efficient coupling of ultraintense laser pulses at a rep rate of kHz like RF couplers for future linear collider applications

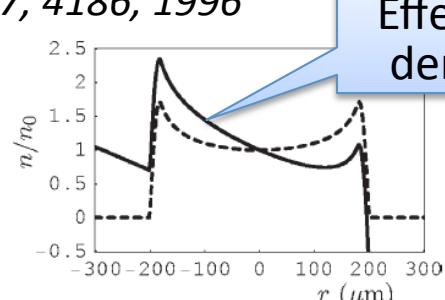

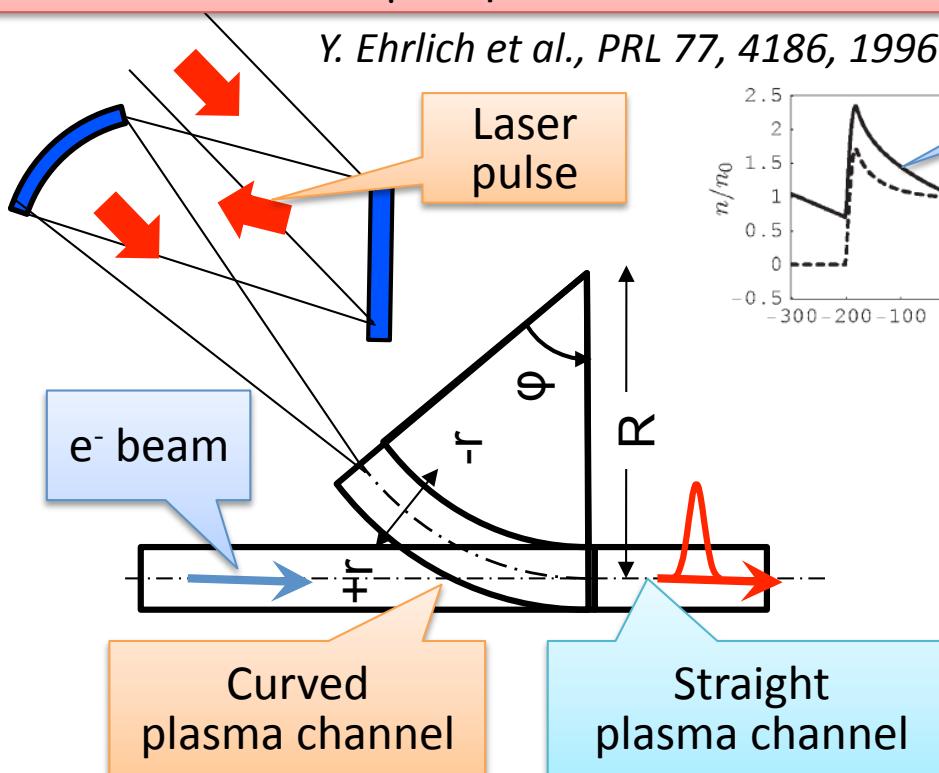

- Laser light is bent by a **curved plasma channel**

$$n(r) = n_0 + \Delta n \frac{r^2}{r_{ch}^2} \quad r_M = \frac{n_c}{\Delta n} \frac{r_{ch}^2}{R}$$

- Shift of equilibrium position

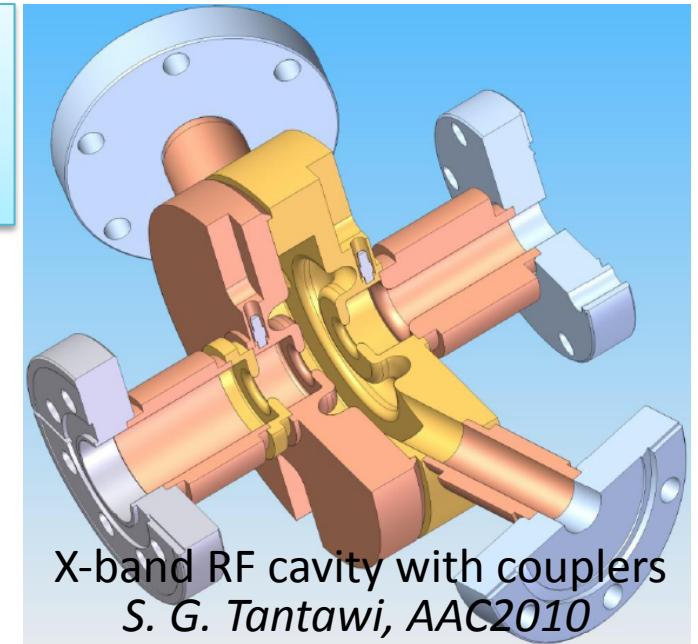

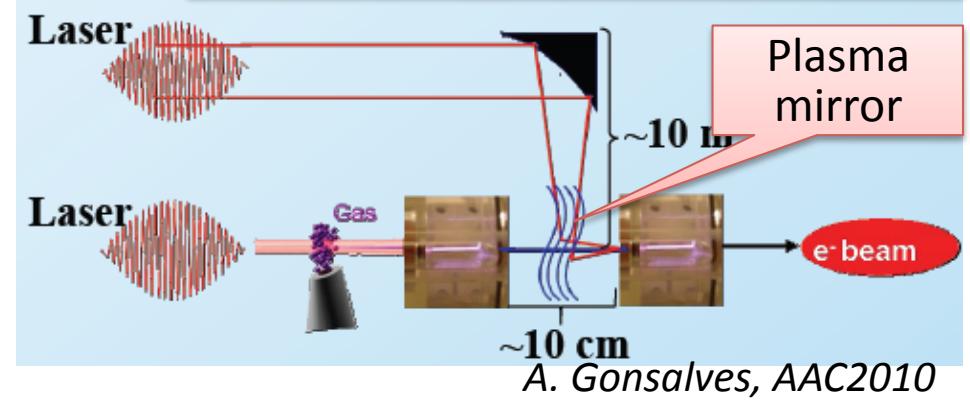

- A minimum acceptable radius of curvature $R \geq \frac{n_c}{\Delta n} r_{ch}$

- The first curved plasma channel experiment with 10 cm radius of curvature showed as high as 85% transmission of 50 μm spot radius for $>10^{16} \text{ W/cm}^2$.

kHz operation possible ?

on-axis injection with a too-big spot size

Staging LWFA with curved plasma channel coupler

Synchronization of two laser pulses will be controlled by frequency domain interferometry with fs resolution

Two pulses split in the time interval T can be observed as fringes in the frequency domain interferogram.

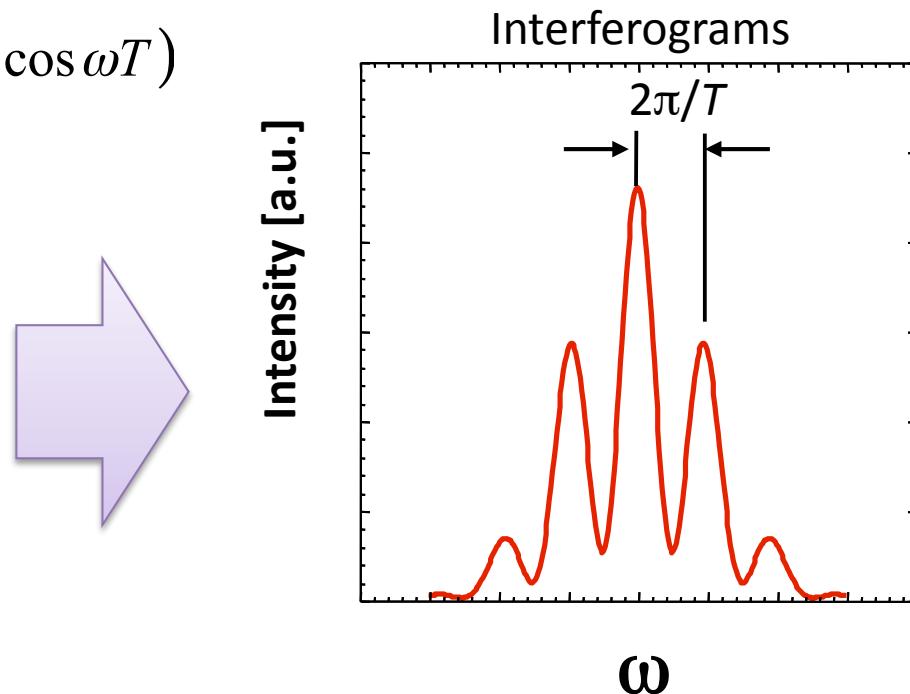

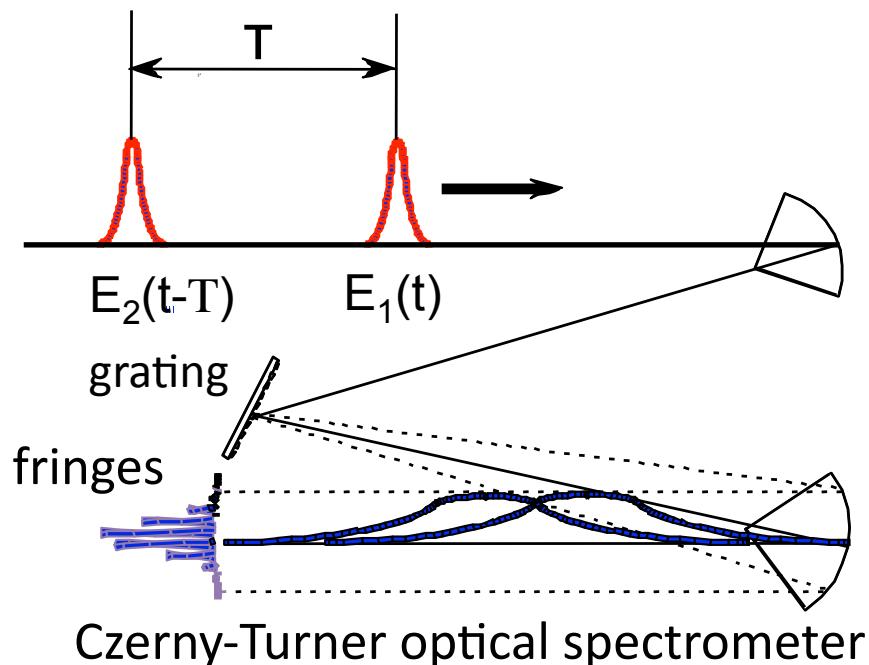

$$E_{tot}(t) = E_1(t) + E_2(t - T)$$

The power spectrum:

$$\begin{aligned} I_{tot}(\omega) &= \frac{1}{2\pi} \left| \int_{-\infty}^{\infty} e^{-i\omega t} [E_1(t) + E_2(t - T)] dt \right|^2 \\ &= |E_1(\omega) + E_2(\omega)e^{-i\omega T}|^2 \end{aligned}$$

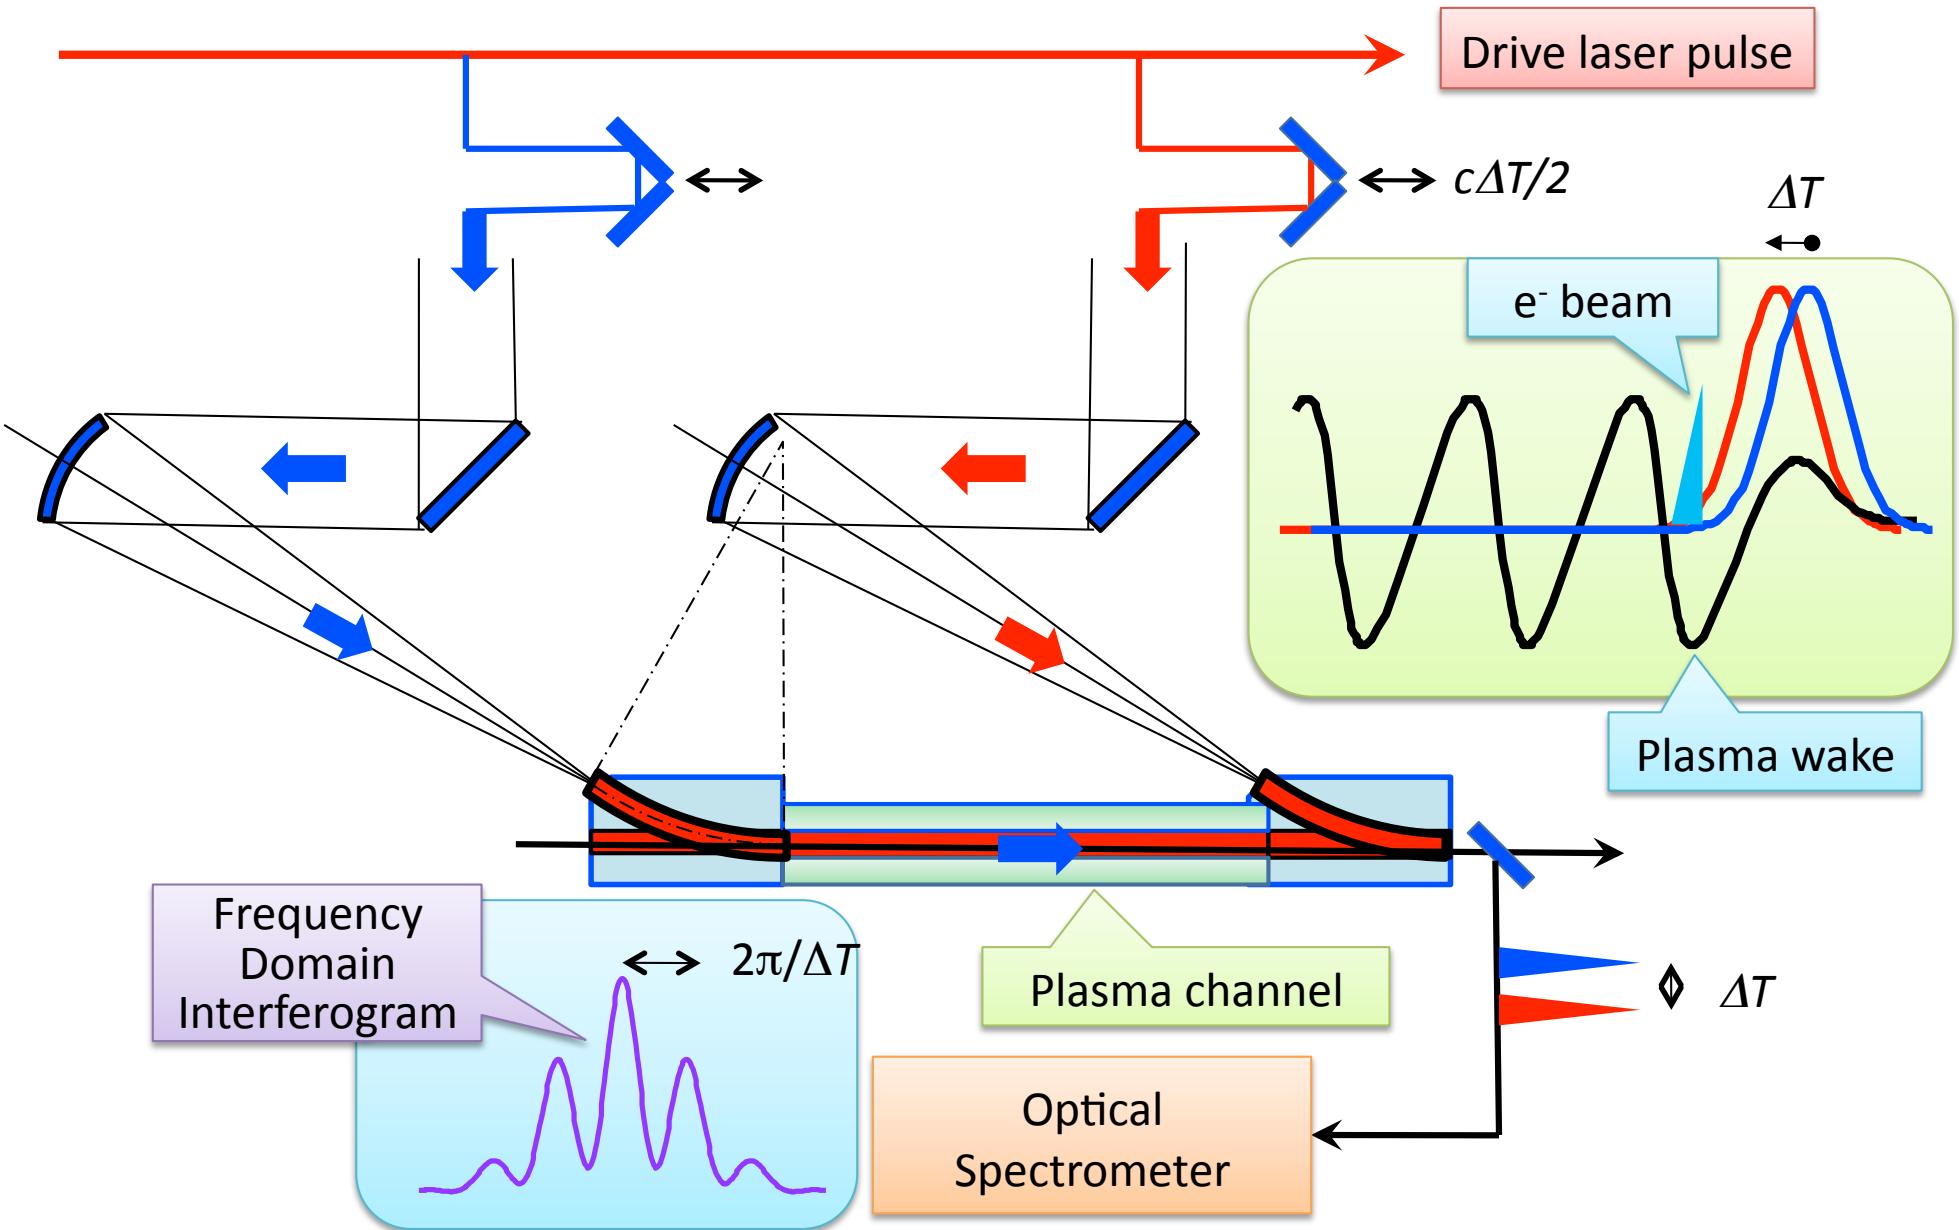

Synchronization
 $T \rightarrow 0$

For $E_1 = E_2$ $I(\omega) = 2|E(\omega)|^2(1 + \cos \omega T)$

150MW average power laser for LWFA collider

suggested by G. Mourou, HEEAUP2005, Paris

Cost
Fiber lasers: \$10/W \times 150MW = \$1.5G
Plasma accelerator: negligible

Power requirement for 3 TeV CLIC with luminosity $10^{35} \text{ cm}^{-2}\text{s}^{-1}$

Number of charge/bunch	4×10^9
Beam energy/bunch	0.96 kJ
Number of bunches/pulse	154
Linac repetition rate	100 Hz
Beam power/beam	14.8 MW
Total AC power	410 MW

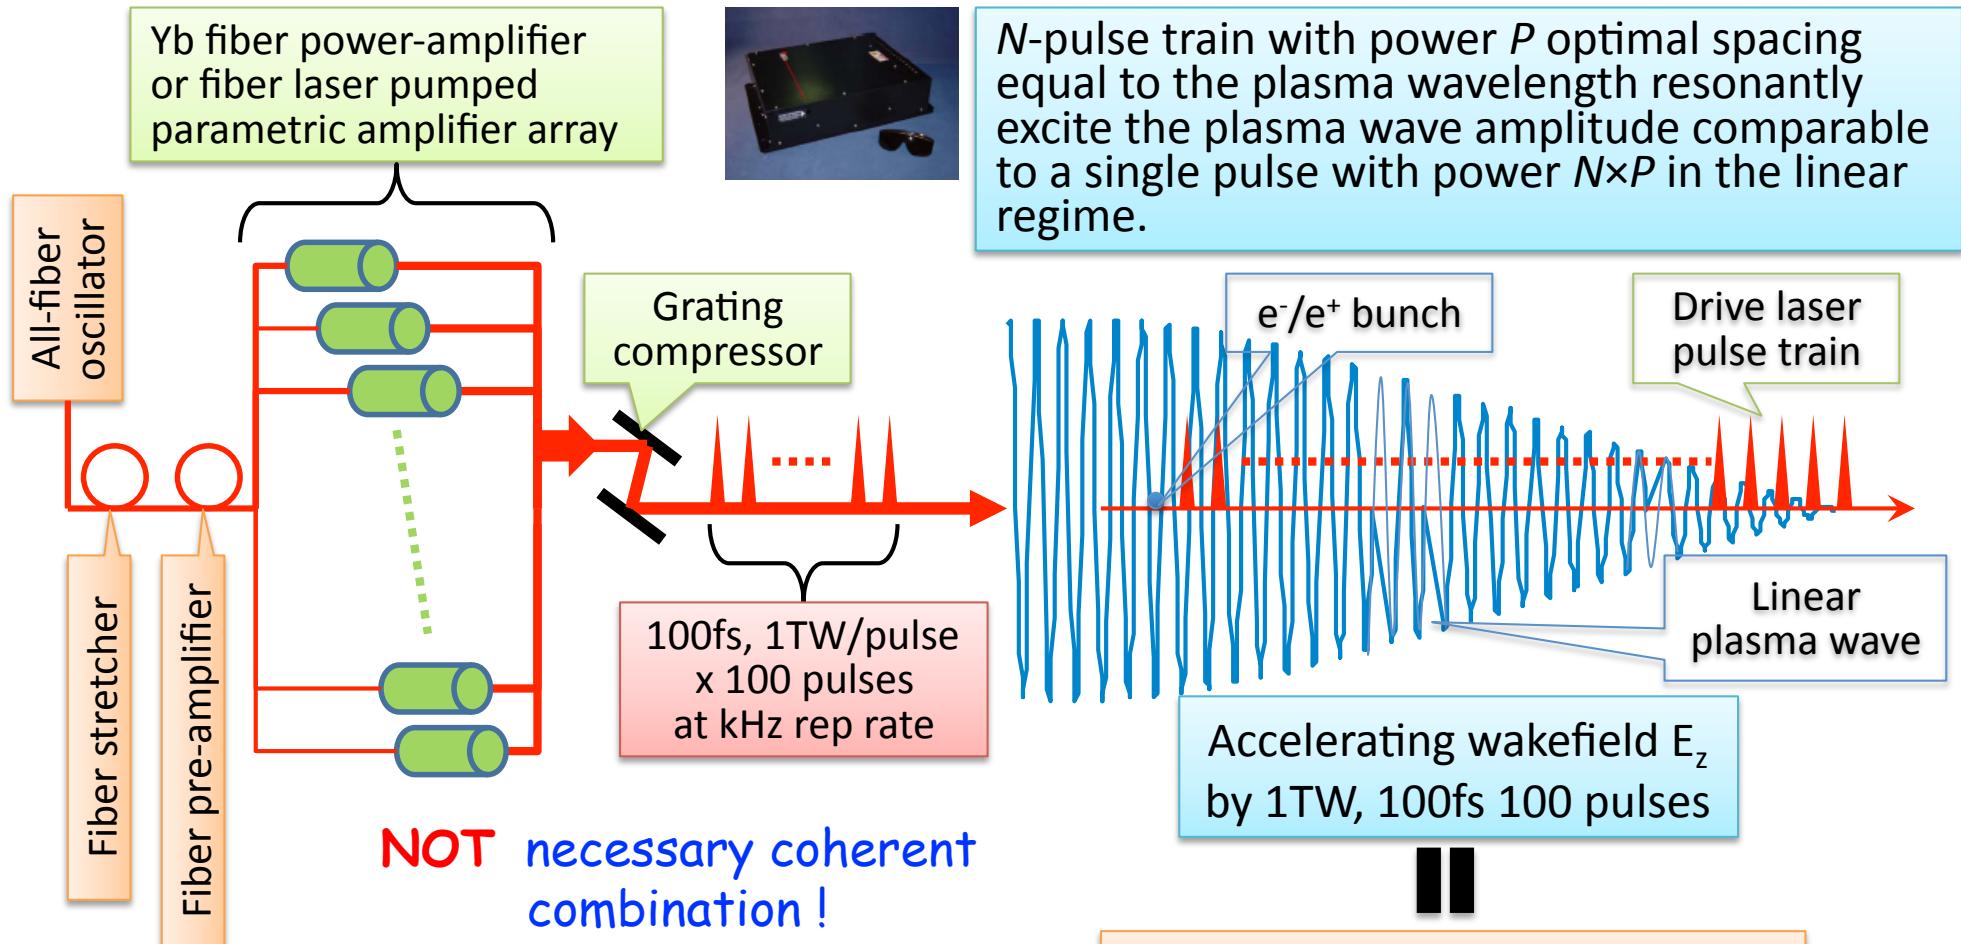

Power requirement for 3 TeV LWFA collider

Wakefield acceleration efficiency	20%
Laser energy/pulse	5 kJ
Peak power of 100 fs laser pulse	50 PW
Repetition rate of LWFA linac	15 kHz
Average driving power for two LWFA	150 MW
Total AC power of fiber lasers with 50%	300 MW

Pulse Train Resonant Laser-Plasma Accelerator

Resonant LPA scheme mitigates requirement of a single ultra-intense laser pulse

With kHz~MHz rep rate TW drive lasers,
RLPA shortcuts to the collider application

||

Accelerating wakefield E_z
by a 100TW, 100fs single pulse

K. Nakajima, PRA, 45, 1149 (1992)
"Plasma-wave resonator for particle-beam acceleration"

Summary

- GeV-range high-quality, controllable and stable electron injectors are available in the state-of-art LPA technology.
- 100 GeV high-quality e^-/e^+ LPA experiment will be carried out with the multi-staging of LWFA operated in the linear regime at plasma density in the order of 10^{-16} cm^{-3} as well as the e^-/e^+ injector in the nonlinear regime.
- Meter-scale Long plasma channels necessary for staging will be generated with RF discharge at kHz-rep rate.
- Curved plasma channel will be used for coupling drive laser pulse in/out the stage at kHz-rep rate.
- Synchronization of stage-to-stage laser pulses will be adjusted by the frequency domain interferometry with fs resolution.
- 10-100 GeV high-resolution spectrometer should be developed.
- RLPA may be useful for future fiber laser-based LWFA operated at kHz-rep rate.
- **LPA community is ready for 100 GeV acceleration and kHz-LWFA with required lasers such as APOLLON and kHz-TW fiber lasers.**
