

Measuring the angle β at a Super B factory

Katherine George

Queen Mary, University of London

5th Super B Workshop
Paris, May 9-11, 2007

Overview

- Measurements of $\sin 2\beta$, $\cos 2\beta$, and limits on β from :
 - β from charmonium,
 - 'complementary measurements' of β from 'open-charm' and other charmonium,
 - 'alternative measurements' of β from penguins.

and extrapolation to higher luminosities.

Many ways to measure $\sin 2\theta$ and $\cos 2\theta$

(More details in following slides ...)

$$b \rightarrow c\bar{c}s$$

charmonium

Many ways to measure $\sin 2\beta$ and $\cos 2\beta$

(More details in following slides ...)

$J/\psi K_S, \psi(2S) K_S, \chi_{c1} K_S$

$\eta_c K_S, J/\psi K_L$

$J/\psi K^{*0} (K_S \pi^0)$

Many ways to measure $\sin 2\beta$ and $\cos 2\beta$

(More details in following slides ...)

$$b \rightarrow c\bar{c}s$$

charmonium

$$J/\psi K_S, \psi(2S) K_S, \chi_{c1} K_S$$

$$\eta_c K_S, J/\psi K_L$$

$$J/\psi K^{*0} (K_S \pi^0)$$

Color-suppressed $b \rightarrow c\bar{u}d$

Many ways to measure $\sin 2\beta$ and $\cos 2\beta$

(More details in following slides ...)

$$b \rightarrow c\bar{c}s$$

charmonium

$J/\psi K_S, \psi(2S)K_S, \chi_{c1}K_S$
 $\eta_c K_S, J/\psi K_L$
 $J/\psi K^{*0} (K_S \pi^0)$

$$b \rightarrow c\bar{c}d \text{ charm or charmonium}$$

$D^{(*)+} D^{(*)-}, J/\psi \pi^0$

Color-suppressed $b \rightarrow c\bar{u}d$

$D^{(*)0} CP h^0, D^{(*)} h^0,$
 latter with $D \rightarrow K_S \pi^+ \pi^-$

Many ways to measure $\sin 2\beta$ and $\cos 2\beta$

(More details in following slides ...)

$$b \rightarrow c\bar{c}s$$

charmonium

$J/\psi K_S, \psi(2S)K_S, \chi_{c1}K_S$
 $\eta_c K_S, J/\psi K_L$
 $J/\psi K^{*0} (K_S \pi^0)$

$$b \rightarrow c\bar{c}d \text{ charm or charmonium}$$

$D^{(*)+} D^{(*)-}, J/\psi \pi^0$

$$b \rightarrow s\bar{s}s \text{ \& } b \rightarrow s\bar{d}d \text{ penguin dominated}$$

$\phi K_S, K^+ K^- K^0,$
 $K_S K_S K_S, \eta' K_S, K_S \pi^0,$
 $\omega K_S, f_0 K_S$

$$\text{Color-suppressed } b \rightarrow c\bar{u}d$$

$D^{(*)0}_{CP} h^0, D^{(*)} h^0,$
 latter with $D \rightarrow K_S \pi^+ \pi^-$

Many ways to measure $\sin 2\beta$ and $\cos 2\beta$

(More details in following slides ...)

$$b \rightarrow c\bar{c}s$$

charmonium

$J/\psi K_S, \psi(2S)K_S, \chi_{c1}K_S$
 $\eta_c K_S, J/\psi K_L$
 $J/\psi K^{*0}(K_S \pi^0)$

$$b \rightarrow c\bar{c}d \text{ charm or charmonium}$$

$D^{(*)+} D^{(*)-}, J/\psi \pi^0$

$$b \rightarrow s\bar{s}s \text{ \& } b \rightarrow s\bar{d}d \text{ penguin dominated}$$

$\phi K_S, K^+ K^- K^0,$
 $K_S K_S K_S, \eta' K_S, K_S \pi^0,$
 $\omega K_S, f_0 K_S$

$$\text{Color-suppressed } b \rightarrow c\bar{u}d$$

$D^{(*)0}_{CP} h^0, D^{(*)} h^0,$

latter with $D \rightarrow K_S \pi^+ \pi^-$

Increasing sensitivity to new physics

Increasing tree diagram contribution

$\sin 2\beta$ from $b \rightarrow cc$ decays

$\sin 2\beta$ from $b \rightarrow cc\bar{s}$

stat. syst.

- o BaBar, 383 M $B\bar{B}$ pairs.
- o hep-ex/0703021, submitted to PRL.

| | |
|---------------------------|---|
| $J/\psi K_S (\pi^+\pi^-)$ | $0.702 \pm 0.042 \pm 0.020$ |
| $J/\psi K_S (\pi^0\pi^0)$ | $0.617 \pm 0.103 \pm 0.036$ |
| $\psi(2S)K_S$ | $0.947 \pm 0.112 \pm 0.062$ |
| $\chi_{c1}K_S$ | $0.759 \pm 0.170 \pm 0.037$ |
| $\eta_c K_S$ | $0.778 \pm 0.195 \pm 0.093$ |

4 solutions for β from the $b \rightarrow cc s \sin 2\beta$ measurement

The 4-fold ambiguity in β - resolved ?

○ Reduce 4-fold ambiguity to 2-fold ambiguity ($\beta \rightarrow \pi/2 - \beta$) by measuring (the sign of) $\cos 2\beta$. Negative $\cos 2\beta$ ruled out by:

-ve solution, $\beta = \phi_1 = (68.7 \pm 1.0)^\circ$

○ Time-dependent Dalitz analysis of

○ BaBar: PRD 74, 091101 (2006), 94% CL.

○ BaBar: hep-ex/060105, 87% CL.

○ Belle: PRL 97, 081801 (2006), 98.3% CL.

○ BaBar: 21° favoured over 69° at 4.6σ level.

○ Time-dependent angular analysis of

○ BaBar: PRD 71, 032005 (2005), 87% CL.

○ Belle: PRL 95, 091601 (2005).

+ve solution, $\beta = \phi_1 = (21.3 \pm 1.0)^\circ$
"Strongly favoured"

We **already** have a 1° measurement of β
- so what next?

- o Achille's talk (yesterday), and the following talks on α and γ will talk about whether 1° measurements of these angles are possible.
 - o We (β) are already there (expect $<1^\circ$ by the end of B-factory running)
 - o **Question: Why push further?**

We **already** have a 1° measurement of β
- why push further?

o Answers.

We **already** have a 1^o measurement of β
- why push further?

- o Answers.
 - o (a) We can - we already know how to do these measurements.
 - o If nothing else its 'a really dumb (?) sanity check'.

We already have a 1° measurement of β - why push further?

- o Answers.
 - o (a) We can - we already know how to do these measurements.
 - o If nothing else its 'a really dumb (?) sanity check'.
 - o (b) The constraints from indirect measurements will also be very stringent.

Direct measurement of $\Phi_d (=2\beta$ in the SM) is tested against indirect prediction which is fixed by R_b (the V_{ub}/V_{cb} side)

R_b now known to 7% from V_{ub} inclusive

→ translates into β indirect of 1.6°

Compare with (Super-)LHCb *stat* error:

| (Super-)LHCb | 2 fb^{-1} | 10 fb^{-1} | 100 fb^{-1} |
|-----------------|---------------------|----------------------|-----------------------|
| σ (stat) | 0.66° | 0.30° | 0.09° |

Looks OK... but precision on R_b will improve as lattice improves V_{ub} exclusive.

Must plan for R_b precision of $\sim 2\%$ → β indirect error then 0.5°

Taken from Guy Wilkinson's talk at the January 2007 LHCb upgrade Workshop.

We already have a 1° measurement of β - why push further?

o Answers.

- o (a) We can - we already know how to do these measurements.
 - o If nothing else its 'a really dumb (?) sanity check'.
- o (b) The constraints from indirect measurements will also be very stringent.

Direct measurement of $\Phi_d (=2\beta$ in the SM) is tested against indirect prediction which is fixed by R_b (the V_{ub}/V_{cb} side)

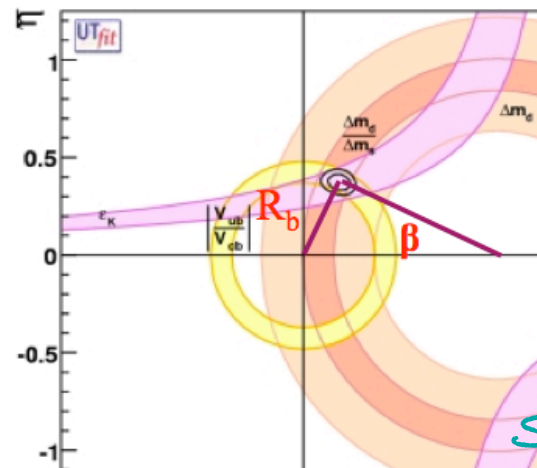

R_b now known to 7% from V_{ub} inclusive

→ translates into β indirect of 1.6°

Compare with (Super-)LHCb *stat* error:

Katherine George. 5th Super B

We **already** have a 1° measurement of β - why push further?

o Answers.

- o (a) We can - we already know how to do these measurements.
 - o If nothing else its 'a really dumb (?) sanity check'.
- o (b) The constraints from indirect measurements will also be very stringent.
- o (c) Although systematics limited, improvements in detector-related systematics will benefit many other analyses.

We **already** have a 1° measurement of \bar{b} - why push further?

- o Answers.
 - o (a) We can - we already know how to do these measurements.
 - o If nothing else its 'a really dumb (?) sanity check'.
 - o (b) The constraints from indirect measurements will also be very stringent.
 - o (c) Although systematics limited, improvements in detector-related systematics will benefit many other other analyses.
 - o (d) It's a 'standard candle'
 - o (1) Comparison with complementary measurements of \bar{b} from $b \rightarrow ccd$ and $b \rightarrow cud$.
 - o (2) Comparison with penguin $b \rightarrow sqq$ modes - a 'standard candle' assumes increased importance as precision on penguin \bar{b} measurements increases.

We **already** have a 1° measurement of β - why push further?

- o Answers.
 - o (a) We can - we already know how to do these measurements.
 - o If nothing else its 'a **really dumb** (?) sanity check'.
 - o (b) The constraints from indirect measurements will also be very stringent.
 - o (c) Although systematics limited, improvements in detector-related systematics will benefit many other other analyses.
 - o (d) It's a 'standard candle'
 - o (1) Comparison with complementary measurements of β from $b \rightarrow ccd$ and $b \rightarrow cud$.
 - o (2) Comparison with penguin $b \rightarrow sqq$ modes - a 'standard candle' assumes increased importance as precision on penguin β measurements increases.
- o Address (c) and (d) in later slides.
- o There are others which I may have forgotten & opinion may vary as to the relative importance of the above answers.

$b \rightarrow cc\bar{s}$ at higher luminosities

(Theory & controlling penguins)

systematics
limited

- Expected precision for $\sin 2\beta$ ($J/\psi K^0_S$) - CDR Table 2-1.

| Observable | HFAQ ($\sim 840 \text{ fb}^{-1}$) | B Factories (2 ab^{-1}) | Super B (75 ab^{-1}) |

Katherine George . 4th International Workshop on the CKM Unitarity Triangle.
December 12th - 16th, 2006, Nagoya, Japan.

$b \rightarrow cc\bar{s}$ at higher luminosities

(Systematics - III)

- ± 0.010 @ $2ab^{-1}$ of which I estimate $\sim \pm 0.008$ is currently “irreducible” with the current detectors.
 - Future improvements can come from:
 - An “improved” detector,
 - Use of higher statistics control samples at Super B,
 - Subsequent improvements in upcoming BaBar/Belle publications.

$b \rightarrow cc$ at higher luminosities

(Systematics - III)

- ± 0.010 @ 2 ab^{-1} of which I estimate $\sim \pm 0.008$ is currently “irreducible” with the current detectors.
 - Future improvements can come from:
 - An “improved” detector,
 - Use of higher statistics control samples at Super B,
 - Subsequent improvements in upcoming BaBar/Belle publications.
- CDR - may be possible to reduce this error to ± 0.005 (total).

| Observable | B Factories (2 ab^{-1}) | SuperB (75 ab^{-1}) |
|------------------------------------|---------------------------------------|---------------------------------|
| $\sin(2\beta)$ ($J/\psi K^0$) | 0.018 | 0.005 (†) |

Complimentary measurements of \mathcal{B}

Complementary measurements of β

$$B^0 \rightarrow J/\psi \pi^0 \text{ and } B^0 \rightarrow D^{+(*)} D^{-(*)}$$

- o Same tree and penguin diagrams as $b \rightarrow ccs$ ('s' replaced by a 'd')
- o Penguin diagram has a different weak phase
- o could have a more significant contribution than in $b \rightarrow ccs$ modes,
- o \therefore sizeable deviations from $b \rightarrow ccs$ may suggest New Physics in the $b \rightarrow d$ penguin topology.
- o e.g. (*) b and gluino masses in the range 100-300 GeV can produce measurable differences in value of $\sin 2\beta$ obtained from $b \rightarrow ccs$ and $b \rightarrow ccd$ decays.

$$B^0 \rightarrow D^{+(*)} D^{-(*)}$$

(*) Y. Grossman and M. P. Worah, Phys. Lett. B **395**, 241 (1997) [arXiv:hep-ph/9612269].

- o $D^+ D^-$ is a CP-eigenstate,
- o $D^{*+} D^{*-}$ is a CP-admixture \therefore angular analysis required.
- o $D^{*+} D^-$ are not CP-eigenstates, but $C=0$ and $S \approx -\sin 2\beta$ in the SM.
- o Penguin contribution expected to be small ($\sim 2-10\%$). Xing, PRD **61**, 014010 (2000).

Time-dependent CP Asymmetries in $b \rightarrow ccd$ transitions ($B^0 \rightarrow J/\psi \pi^0$)

232 M BB pairs.

152 M BB pairs.

$J/\psi \pi^0 S_{CP}$

HFAG
ICHEP 2006
PRELIMINARY

$J/\psi \pi^0 C_{CP}$

HFAG
ICHEP 2006
PRELIMINARY

- o Current measurements indicate that $S(J/\psi \pi^0)$ and $C(J/\psi \pi^0)$ are consistent with $S = -\sin 2\beta_{b \rightarrow cc s}$ and $C = 0$.

Time-dependent CP Asymmetries in $b \rightarrow ccd$ transitions ($B^0 \rightarrow D^+ D^-$)

383 M BB pairs.

535 M BB pairs.

$D^+ D^- S_{CP}$

$D^+ D^- S_{CP}$ vs C_{CP}

HFAG
Moriond 2007
PRELIMINARY

- o Belle : Evidence for direct CPV at 3.2 σ .
 - o Not confirmed by BaBar.
- o Belle result is outside of physical region, with the average very close to the boundary.
 - o **HFAG warning** - interpret average with care.

Time-dependent CP Asymmetries in $b \rightarrow ccd$ transitions

(Evidence for CP violation in $B^0 \rightarrow D^{*+}D^-$)

383 M BB pairs.

185 M BB pairs.

- o Not a CP eigenstate.
- o Analyse $D^{*+}D^-$ and $D^{*-}D^+$ modes separately.

$$\frac{A(D^{*+}D^-)}{A(D^{*-}D^+)} = Re^{i\delta}$$

$$S_{\pm} = \frac{2R \sin(2\beta \pm \delta)}{1 + R^2}$$

$$(S_+ - S_-)/2 = \frac{2R}{1 + R^2} \cos \delta \sin 2\beta$$

- o If no CPV (and no penguin),

$$S_+ = S_- \text{ and } C_+ = C_-$$

- o $\cos \delta \sin 2\beta \neq 0$ at 4σ level.

Complementary measurements of β

$B^0 \rightarrow D^0 h^0$

With multi-body decays

- o e.g. $D^0 \rightarrow K^0_S \pi^+ \pi^-$
- o Time-dependent Dalitz analysis of the D decay allows a direct determination of β .
- o Measure both $\cos 2\beta$ and $\sin 2\beta$.
- o Belle : $\cos 2\beta > 0$ @ 98.3% CL.
- o BaBar : $\cos 2\beta > 0$ @ 87% CL.

Without multi-body decays

- o BaBar : hep-ex/0703019
 - o $\sin 2\beta_{\text{eff}} = +0.56 \pm 0.23 \pm 0.05$
 - o $C = -0.23 \pm 0.16 \pm 0.04$

Time-dependent CP Asymmetries in $b \rightarrow ccd$ transitions (Systematics)

| Observable | B Factories (2 ab^{-1}) | Super B (75 ab^{-1}) |
|------------------------------------|---------------------------------------|------------------------------------|
| $\sin(2\beta)$ ($J/\psi K^0$) | 0.018 | 0.005 (†) |
| $\cos(2\beta)$ ($J/\psi K^{*0}$) | 0.30 | 0.05 |

| $S(D^+D^-)$ | 0.20 | 0.03 |

- Selected 'complementary' measurements of β from $b \rightarrow ccd$ transitions are not limited by systematics, statistics or theoretical errors.
- Complementary measurements of β ~ few degrees are achievable.

$\sin 2\theta_{\text{eff}}$ from penguins

$\sin 2\beta$ in $b \rightarrow s$ penguin dominated modes

- $b \rightarrow s$ penguin dominated modes, e.g. $B^0 \rightarrow \phi K_S^0$, $B^0 \rightarrow \eta' K_S^0$, $B^0 \rightarrow K^0 K^0 K^0$ (reconstructed as $B^0 \rightarrow K_S^0 K_S^0 K_S^0$), $B^0 \rightarrow \pi^0 K_S^0$, $B^0 \rightarrow \rho^0 K_S^0$, $B^0 \rightarrow \omega K_S^0$, $B^0 \rightarrow \pi^0 \pi^0 K_S^0$ and $B^0 \rightarrow f_0 K_S^0$, are some of the most interesting places to look for New Physics effects.
 - "Of the penguin modes, only ϕK_S^0 really possible at LHCb". [Wilkinson, LHCb upgrade workshop, Jan 2007](#).
- Modes with the smallest theoretical uncertainties are $B^0 \rightarrow \phi K_S^0$, $B^0 \rightarrow \eta' K_S^0$, and $B^0 \rightarrow K^0 K^0 K^0$.

- How large can ΔS_f be in the SM?

$$\Delta S_f \equiv -\eta_f S_f - S_{J/\psi K_S}$$

Tables taken from Chua, hep-ph/0605301.
 Proceedings of talk given at FPCP'06.

Theoretically limited at 75 ab^{-1}

- $B^0 \rightarrow \eta' K_s^0$ becomes theoretically dominated earlier than other penguin modes. Proposed use of “data-driven” methods to control theoretical errors.
 - Grossman, Ligetti, Nir & Quinn (hep-ph/0303171),
 - Gronau, Rosner & Zupan (hep-ph/0403027 and hep-ph/0608085).

α and $\beta_{b \rightarrow cc s}$ in the ρ - η plane

β in the $\bar{\rho} - \bar{\eta}$ plane

(Plots from A. Bevan)

- Input:
 - $b \rightarrow \text{ccs } \beta$ from HFAG (21.3°).
- Assumption on error 'scaling':
 - β - taken from CDR Table 2-1.
 - $2 \text{ ab}^{-1} (\pm 0.7^\circ)$ and $75 \text{ ab}^{-1} (\pm 0.2^\circ)$

using α and β to constrain the unitarity triangle

(Plots from A. Bevan)

Inputs:

- α from BABar $B^0 \rightarrow \rho^+ \rho^-$ (95°).
- $b \rightarrow ccs \bar{b}$ from HFAQ (21.3°).
- No input from γ .

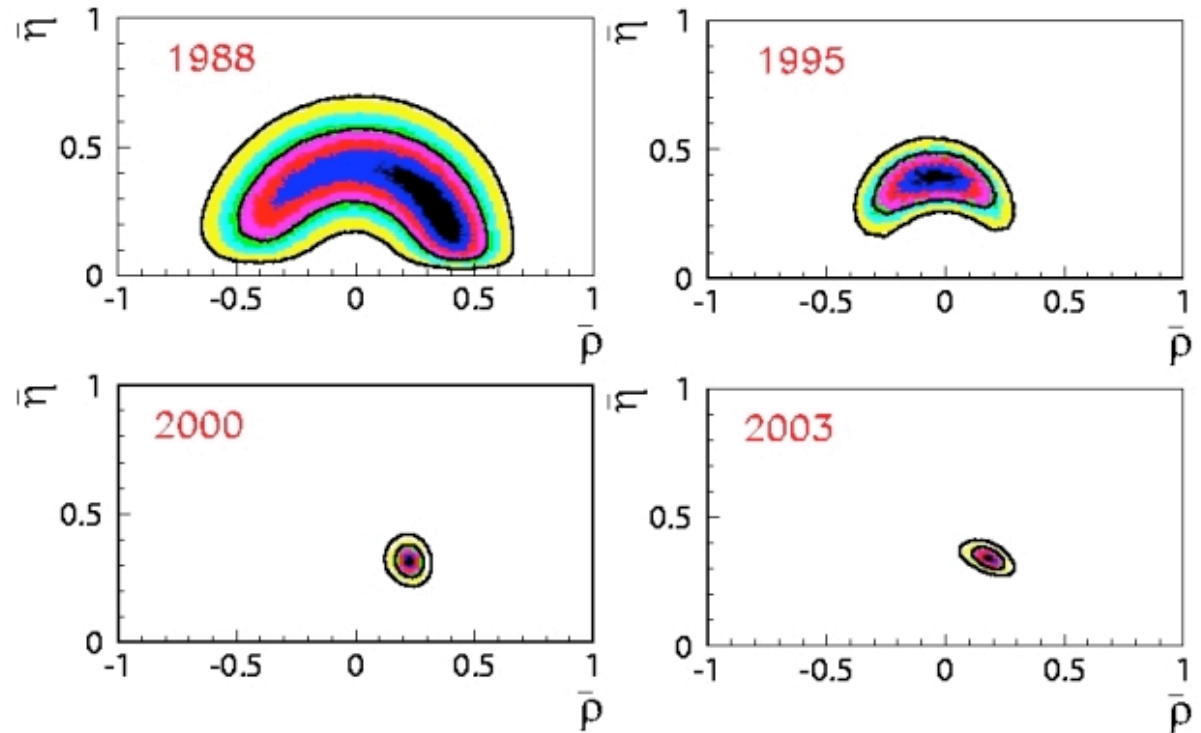

Assumptions on error 'scaling':

- α - see Adrian's talk
- β - taken from CDR Table 2-1.

The 30 year evolution ? (1988 - 2018)

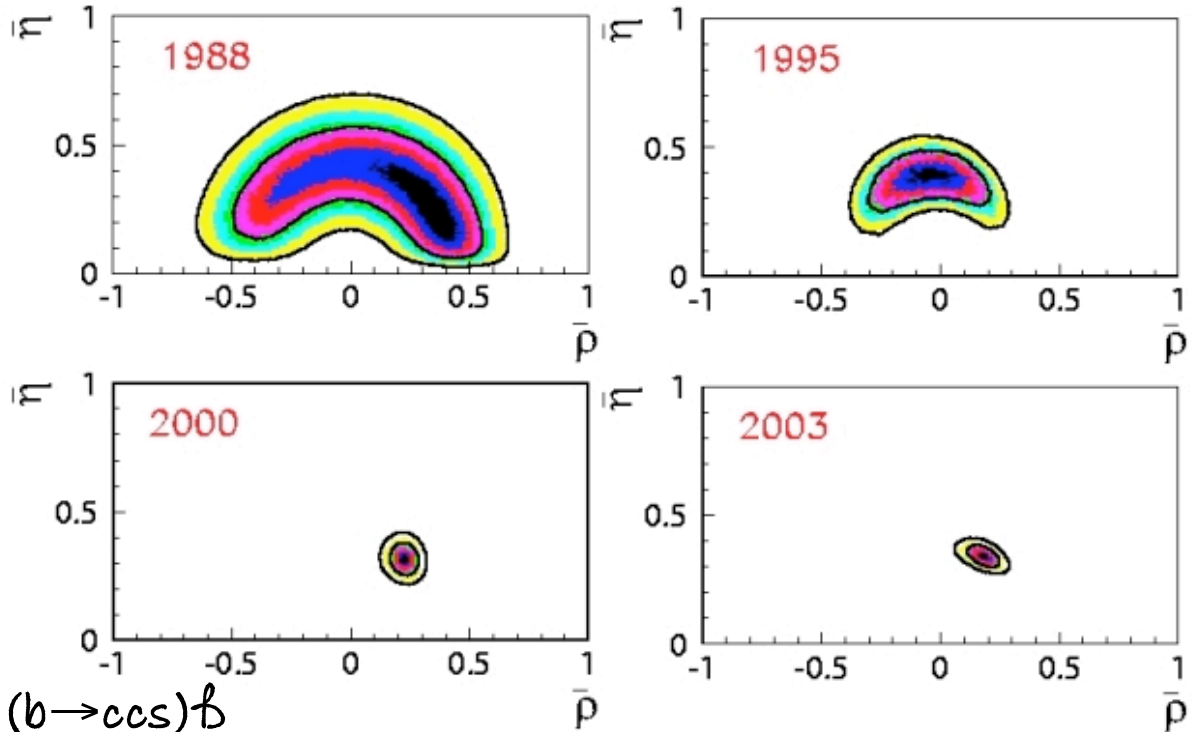

o 15 year evolution from
UT Fit ...

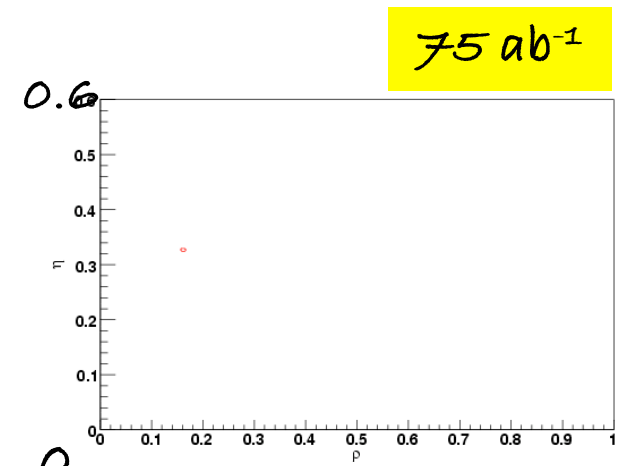

The 30 year evolution ?

(1988 - 2018)

○ 15 year evolution from UT Fit ...

○ Only assuming an α and $(b \rightarrow ccs)\beta$ evolution. Note the smaller axis ranges.

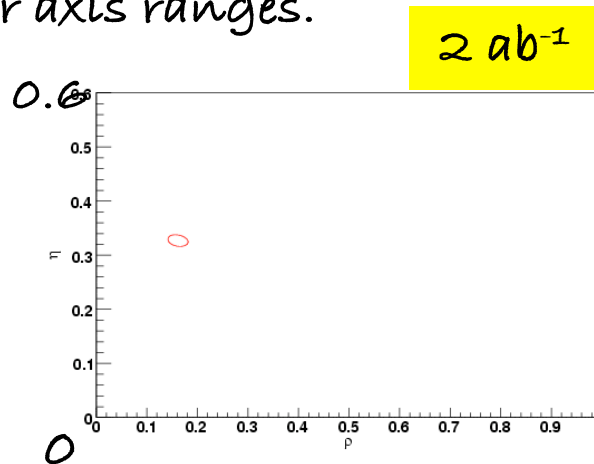

The 30 year evolution ? (1988 - 2018)

○ 15 year evolution from UT Fit ...

○ Only assuming an α and $(b \rightarrow ccs)\beta$ evolution. Note the smaller axis ranges.

The 30 year evolution ?

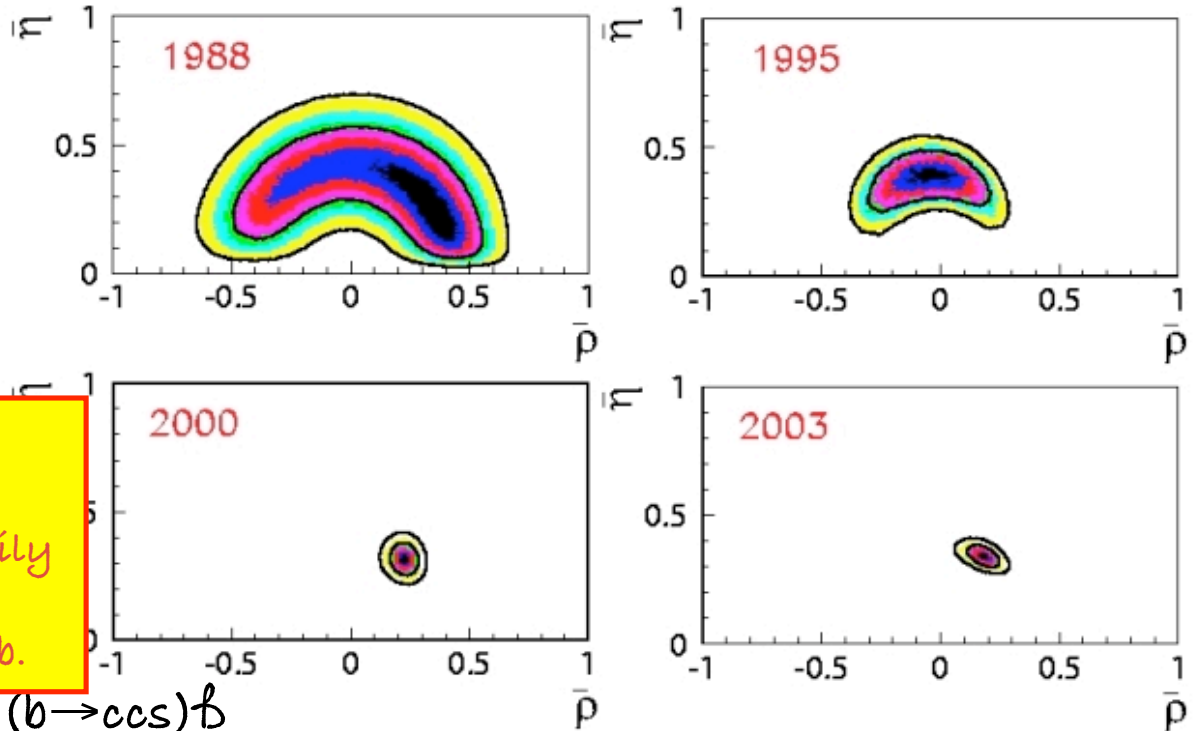

(1988 - 2018)

o 15 year evolution from UT Fit ...

WARNING !!

- Just for illustration!
- Past performance is not necessarily an indication of future returns !
- Excludes many things e.g. LHCb.

o Only assuming an α and $(b \rightarrow ccs)\beta$ evolution. Note the smaller axis ranges.

Summary

Summary

- Sub-1° measurements of β_{ccs}
 - Effort needed in reducing the “irreducible” systematics:
 - vertexing, tag-side interference and beam-spot.
 - “Data-driven” method to control penguins will prove even more useful at a higher luminosity.
- Experiments in a hadronic environment are not competitive for:
 - the ‘complementary’ ($b \rightarrow ccd$) measurements of β , (not systematics, statistics or theoretically limited at Super B)
 - the ‘alternative’ ($b \rightarrow s$ penguin) measurements of β (theoretically limited at Super B).
- Not the *raison d’être* for Super B, but measuring β is a necessary part of the program.
