TDC Measurements

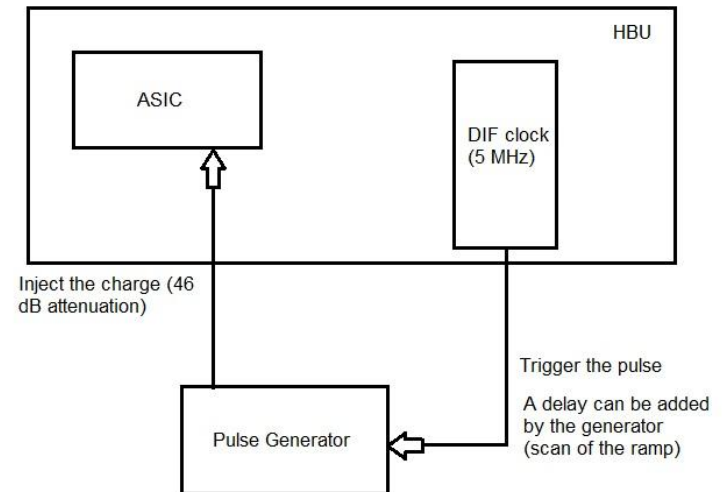

Goal of time measurement and working principle

- Improve the resolution of the detector
- Time cut for overlapping showers
- Working principle :
 - Dual TDC ramp in SPIROC switch by a multiplexer

Setup

- > One HBU with DIF board, Calib board and Power board
- > Charge injection : pulse generator synchronize to the clock
- > LED : use of LCS by Labview software
- > Measurements : 100 cycles and 16 triggers (for good statistics)

ILC mode

- 5 MHz clock cycle = 200 ns ramp length
- Design resolution : 100 ps
- Scan of the ramp by variation of the delay between trigger and pulse output (done by step of 5-10 ns)
- Comparison between channel 3 and 4

ILC mode

➤ Fitting by a 1st polynomial function

➤ Resolution :

$$\sigma_{tot} = \frac{\sqrt{\sigma_{histo}^2 + \sigma_{fit}^2}}{slope_{fit}}$$

➤ Several methods in the middle of the ramp :

- Lower part
- Upper part
- All the ramp

Results Table

- > Average Resolution : 150-350 ps
- > Far from design
- > Need to improve by increasing the ramp slope

| Channel | Ramp | Part | σ_{fit} | Slope | σ_{tot} [ns] |
|---------|------|-------|----------------|-------|---------------------|
| 3 | 1 | lower | 1.60 | 7.65 | 0.21 |
| 3 | 1 | upper | 1.12 | 7.03 | 0.16 |
| 3 | 2 | lower | 0.87 | 7.42 | 0.12 |
| 3 | 2 | upper | 0.54 | 6.80 | 0.08 |
| 3 | 1 | all | 3.20 | 7.35 | 0.436 |
| 3 | 2 | all | 2.52 | 7.14 | 0.354 |
| 4 | 1 | all | 0.67 | 6.91 | 0.1 |
| 4 | 2 | all | 3.15 | 7.33 | 0.43 |
| 4 | 2 | lower | 2.6 | 7.75 | 0.34 |
| 4 | 2 | upper | 0.76 | 7.01 | 0.11 |

Spectrum

- Fire random pulse with the pulse generator give a TDC Spectrum
- Characterize the ramps : height and deadtime
- Deadtime : 35% of the ramp length
- Height difference : 45 TDC tics

Improvement of the resolution

- Soldering resistor on the slope bias point
- Range from 30 k Ω to 8 k Ω
- Improvement by factor of 1.2-1.5
- Results Table : 8 k Ω (left) and 30 k Ω (right)

| <i>Channel</i> | <i>Ramp</i> | <i>Part</i> | σ_{fit} | <i>Slope</i> | $\sigma_{tot}[ns]$ |
|----------------|-------------|--------------|----------------|--------------|--------------------|
| 4 | 1 | <i>lower</i> | 0.13 | 11.33 | 0.018 |
| 4 | 1 | <i>upper</i> | 1.87 | 10.38 | 0.18 |
| 4 | 2 | <i>lower</i> | 0.2 | 10.30 | 0.02 |
| 4 | 2 | <i>upper</i> | 2.36 | 10.24 | 0.23 |
| 4 | 1 | <i>all</i> | 2.00 | 10.84 | 0.19 |
| 4 | 2 | <i>all</i> | 3.44 | 10.46 | 0.33 |

| <i>Channel</i> | <i>Ramp</i> | <i>Part</i> | σ_{fit} | <i>Slope</i> | $\sigma_{tot}[ns]$ |
|----------------|-------------|--------------|----------------|--------------|--------------------|
| 4 | 1 | <i>lower</i> | 2.5 | 11.32 | 0.22 |
| 4 | 1 | <i>upper</i> | 2.01 | 10.22 | 0.19 |
| 4 | 2 | <i>lower</i> | 2.95 | 10.63 | 0.28 |
| 4 | 2 | <i>upper</i> | 1.58 | 10.08 | 0.16 |
| 4 | 1 | <i>all</i> | 4.03 | 10.79 | 0.37 |
| 4 | 2 | <i>all</i> | 2.65 | 10.43 | 0.25 |

Testbeam mode

- Different clock frequency (can be chosen – 200 kHz to 625 kHz)
- Step of 200 ns
- Comparison function of the frequency :
 - Dynamic range (2000 TDC tics at 250 kHz against < 1000 TDC tics at 625 kHz)
 - Deadtime (relative to the frequency – less deadtime at low frequency)

Testbeam mode

- Same fitting as in ILC mode
- Problem with the pulse generator at $2\ \mu\text{s}$ – decrease the resolution
- Spectrum : flat distribution – no deadtime apparent and no height difference
- Improvement of the resolution :
 - Soldering a $120\ \text{k}\Omega$ resistor at $312\ \text{kHz}$ (to avoid a saturation of the TDC)
 - Results : Better dynamic range and resolution roughly increased

Results

> Table results :

▪ 250 kHz

| Channel | Ramp | Part | σ_{fit} | Slope | σ_{tot} [ns] |
|---------|------|-------|----------------|-------|---------------------|
| 4 | 1 | lower | 1.06 | 0.698 | 1.53 |
| 4 | 1 | upper | 0.39 | 0.682 | 0.61 |
| 4 | 2 | lower | 0.59 | 0.674 | 0.91 |
| 4 | 2 | upper | 0.51 | 0.671 | 0.79 |
| 4 | 1 | all | 2.92 | 0.695 | 4.21 |
| 4 | 2 | all | 0.49 | 0.673 | 0.78 |

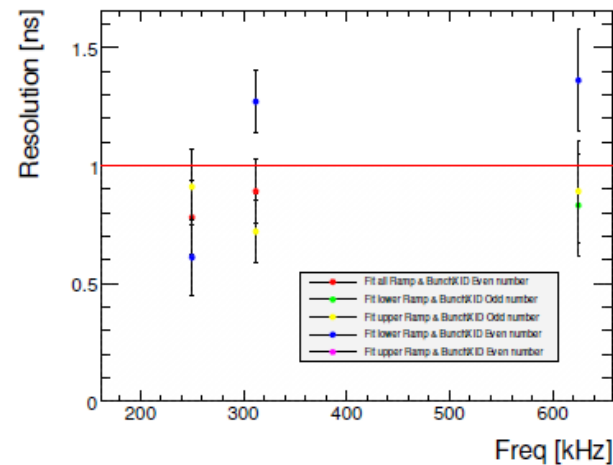

▪ 625 kHz

| Channel | Ramp | Part | σ_{fit} | Slope | σ_{tot} [ns] |
|---------|------|-------|----------------|-------|---------------------|
| 4 | 1 | lower | 0.52 | 0.685 | 0.83 |
| 4 | 1 | upper | 0.91 | 0.687 | 1.36 |
| 4 | 2 | lower | 0.60 | 0.711 | 0.89 |
| 4 | 2 | upper | 0.40 | 0.681 | 0.67 |
| 4 | 1 | all | 0.91 | 0.683 | 1.37 |
| 4 | 2 | all | 1.59 | 0.694 | 2.31 |

Resolution

- Focusing on compromise between dynamic range, relative deadtime and resolution
- Deadtime roughly constant : 70 ns
- Best compromise (without increasing slope) :
 - 250 kHz (or lower than 312 kHz)
 - Deadtime : 2-2.5 %
 - Resolution : 1 - 1.5 ns
 - Dynamic range : 1500 – 2000 TDC tics

Conclusion

> ILC mode :

- 100 – 250 ps resolution achieved
- Spectrum measurement : ~ 50 TDC tics of height difference
- Deadtime too big (35%)
- Fail of distinguishing the ramp by BXID

> Testbeam mode :

- 1 – 1.5 ns resolution achieved
- Frequency comparison (250 kHz to 625 kHz)
- Spectrum measurement : no visible height difference
- Compromise between resolution, deadtime and dynamic range
- Could improve the resolution (< 1 ns) by increasing the slope

The Time walk effect

Explaining of the effect

- Dependence of the trigger with the amplitude of the signal
 - High amplitudes trigger before small amplitudes
 - Imply a time difference between the trigger

Charge injection measurements

> ILC mode :

- Same setup used
- Variation of the voltage (Amplitude) and plotting the time (TDC) function of the Amplitude (ADC)

> Fitting function $[1]/(x^{[3]}-[2]) + [0]$

> Different shapes

> Offset channel to channel

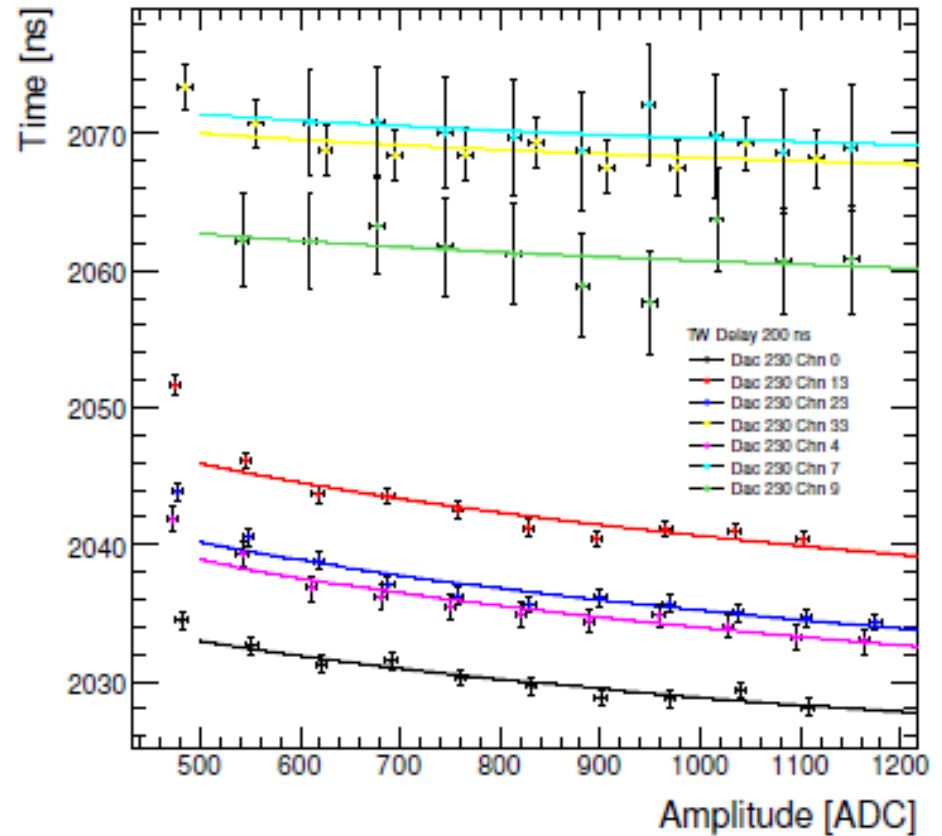

> Channel can't be compared

Charge injection measurements

➤ Testbeam mode :

- Same effect as in ILC mode
- Error bar bigger (divided by 10 on the plot)
- Investigation of this – revealed TDC memory cell offset

Calculated offsets : ILC mode

| Channel | [0] (ns) | [1] (ADC.ns) | [2] (ADC) | [3] | Chi ² |
|---------|----------|--------------|-----------|------|------------------|
| 0 | 246.074 | 6520.56 | 283.892 | 1.06 | 0.09 |
| 4 | 254.109 | 5.66e6 | 84320.1 | 2.13 | 0.11 |
| 7 | 245.258 | 8154.71 | 472.471 | 1.13 | 0.06 |
| 15 | 251.018 | 31010 | 1532.75 | 1.32 | 0.02 |
| 26 | 255.386 | 5324.38 | 292.758 | 1.04 | 0.18 |
| 34 | 252.865 | 9199.02 | 390.991 | 1.11 | 0.12 |
| 9 | 141.225 | 116.531 | 0.18 | 0.04 | 3.18 |
| 32 | 246.138 | 518.118 | 30.72 | 0.64 | 0.05 |
| 33 | 250.281 | 182357 | 1342.51 | 1.63 | 0.06 |

Calculated offsets : Testbeam mode

| Channel | [0] (ns) | [1] (ADC.ns) | [2] (ADC) | [3] | Chi ² |
|---------|----------|--------------|-----------|-------|------------------|
| 0 | 1032.16 | 1025.52 | 0.013 | 0.006 | 4.35 |
| 13 | 1042.9 | 1034.43 | 0.016 | 0.007 | 11.63 |
| 23 | 1039.19 | 1031.02 | 0.015 | 0.007 | 9.86 |

| 4 | 1037.96 | 1013.96 | 0.03 | 0.007 | 3.17 |
| 7 | 1044.39 | 1032.97 | 0.009 | 0.002 | 0.43 |
| 9 | 1040.84 | 1027.92 | 0.011 | 0.003 | 1.87 |

Light Calibration System measurements (LED)

> ILC mode :

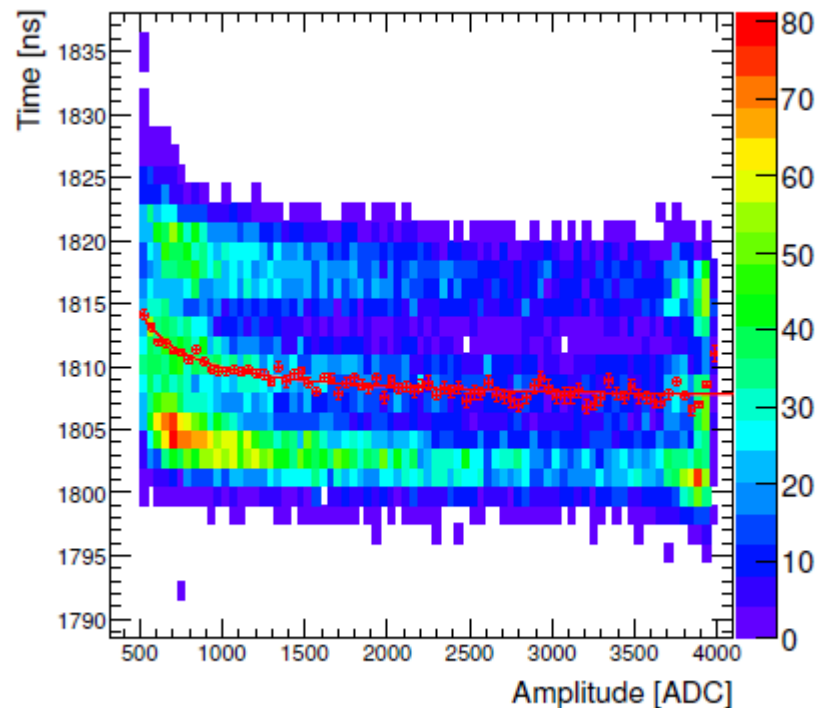

- Same behavior as charge injection
- Projection of the 2D histogram
- Spread around the mean – certainly due to the LED trigger system and the fact that the LED has not always the same amplitude (fluctuations)

Light Calibration System measurements (LED)

> Testbeam mode :

- Same setup
- Spread much more larger than in ILC mode
– consequence of the memory offset and
slope < 1 TDC tics/ns induces more
sensibility to noise

Timing Correction Procedure

- Procedure to calculate offset channel to channel in any mode
- Extend to a whole HBU
- Calculate offset using LED data
- Take into account : memory cell offset (need to check the reproducibility) and LED jitter (difference between trigger and pulse of the LED)

Vcalib=10V. Timing in ns. View on TILE side of HBU. CIF on right side

Preliminary results

- Procedure applied to LED data in ILC mode
- Only 4 channels presents good data
- Give a lookup table

Preliminary results

| Chip | Channel | Moy_offset | LED_Jitter | Offset_corrected |
|------|---------|------------|------------|------------------|
| 0 | 0 | 221.585 | 6 | 215.606 |
| 0 | 23 | 228.006 | 8.3 | 219.634 |
| 0 | 33 | 229.488 | 6.7 | 221.523 |
| 0 | 9 | 217.145 | 4 | 212.586 |

- > Results (offset channel to channel) can be compared between charge injection and correction (check if match)
- > Need to take more data

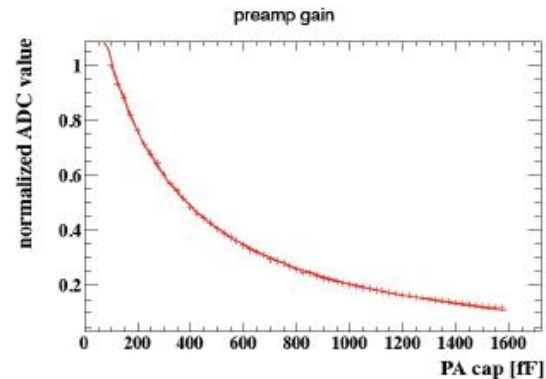

Conclusion

- > Measurements performed on the linearity and resolution of the TDC in SPIROC and time walk effect analyzed
- > TDC measurements :
 - ILD mode : resolution around 150-200 ps, ramp height differs up to 50 TDC tics, huge deadtime, improvement can be made by increasing the slope
 - Testbeam mode : resolution around 1-1.5 ns, choice of 250 kHz frequency – deadtime $\sim 1\%$, good dynamic range (2000 TDC tics), improvement can be made also by increasing the slope (achieve a resolution $< 1\text{ns}$)
- > Time walk effect :
 - Inverse function : $[1]/(x^{[3]}-[2]) + [0]$
 - Calculate offset channel to channel using LCS
 - Timing correction procedure has to be performed in order to compare channel timing (needed for testbeam in November at CERN)

➤ Commissioning of the 4 HBU for testbeam at CERN in November

- Calculate Input DACs for each SiPM
- Pre-Amplifier equalization
- Noise measurement (Set Trigger threshold)
- ADC to MIP Calibration
- Timing correction (lookup table for each HBU)
- Timing measurement (study the timing of em shower)
- Playing around with Temperature
- ...

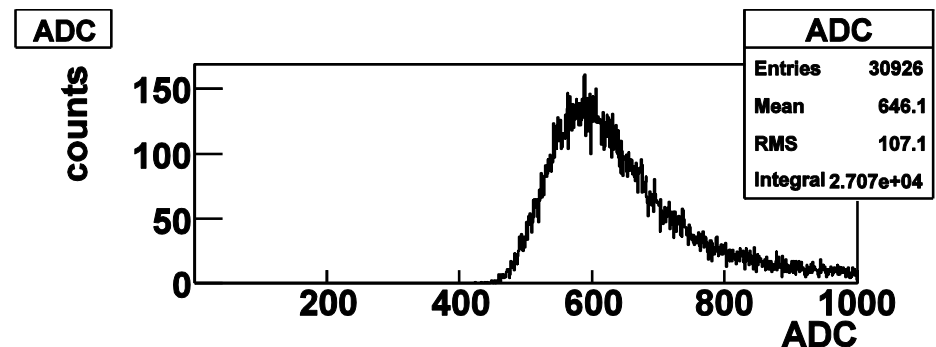

> Testbeam at the end of my internship

- Begin to take data
- Results not so long ago

> What we do :

- Determine where the beam is hitting
- Determine a threshold to have a correct MIP Spectrum
- Acquire MIPs on some channels

> Some results :

A new prototype : SPIROC2c

- New prototype arrived beginning of August : SPIROC2c
- Holdscan performed in external trigger
- Studies ongoing : holdscan, pedestal shift, zero event...

Backup Slides

The International Linear Collider

- 30 km long
- e^+e^- linear collider at 500 GeV (upgrade to 1 TeV)
- Precision Measurements (low background)
- 2 complementary detectors technologies (SiD and ILD)
- Planned for ~ 2020

9GAG.COM/GAG/4728878

The ILD (International Linear Detector)

- > One of the detector prototype
- > High granularity – Particle Flow Algorithms to trace single particles in jets
- > Composed by :
 - Vertex Detector (scintillator strips)
 - Time projection chamber (trace charge particles – up to 224 points)
 - ECAL (silicon pixels or scintillator strips with W or Fe)
 - HCAL (scintillator tiles + SiPM or gas detector as active medium)
 - Cole and Yoke (channel magnetic field and tracking muons)

The AHCAL prototype

- Analog readout using scintillator tiles ($3 \times 3 \text{ cm}^2$) and SiPM
- 18 mm thick (10 mm W or Fe, 3 mm tiles, 5 mm electronics)
- Front-end : SPIROC
- 36 channel, auto-trigger, 2 gain modes, time measurement (TDC)
- HBU : 4 chips = 144 tiles
- Slab : 6 HBU = 24 chips = 864 tiles
- Power consumption : $40 \mu\text{W}/\text{channel}$

SPIROC : Silicon PM Integrated Read Out Chip

- > 2 Gains possible : Haut Gain (75) et Bas Gain (7,5)
- > 36 voies par gain
- > Déclenchement intégré (Trigger)
- > Mesure : 1 pe (160 fC) -> 2000 pe
