+ the team involved in the construction of the antennas (proto@Meudon + Nançay)  
 see <http://francoisrigaud.olympie.in/paon/>

# BAORadio projects

R&D on receivers. SAP and CEA team work on the Pittsburgh cylinders project.

Test obs. @ NRT (HI obs. of cluster galaxies - JEC talk)

## **Talk outline :**

- Suggestion to use a focal array for the NRT for BAO+other projects
- PAON project → PAON2 (2012)
- Construction of a 4 antenna demonstrator: PAON4 (2014)
- Operation and future observations with PAON4

# FAN prototype receiver(1)

**Present system** : 3 SKADS tiles (1m x 3m), 192 Vivaldi antennas grouped by 16 → 12 pixels. Use the BAORadio analog and digital acquisition boards and PCs. Lack of a beamformer.

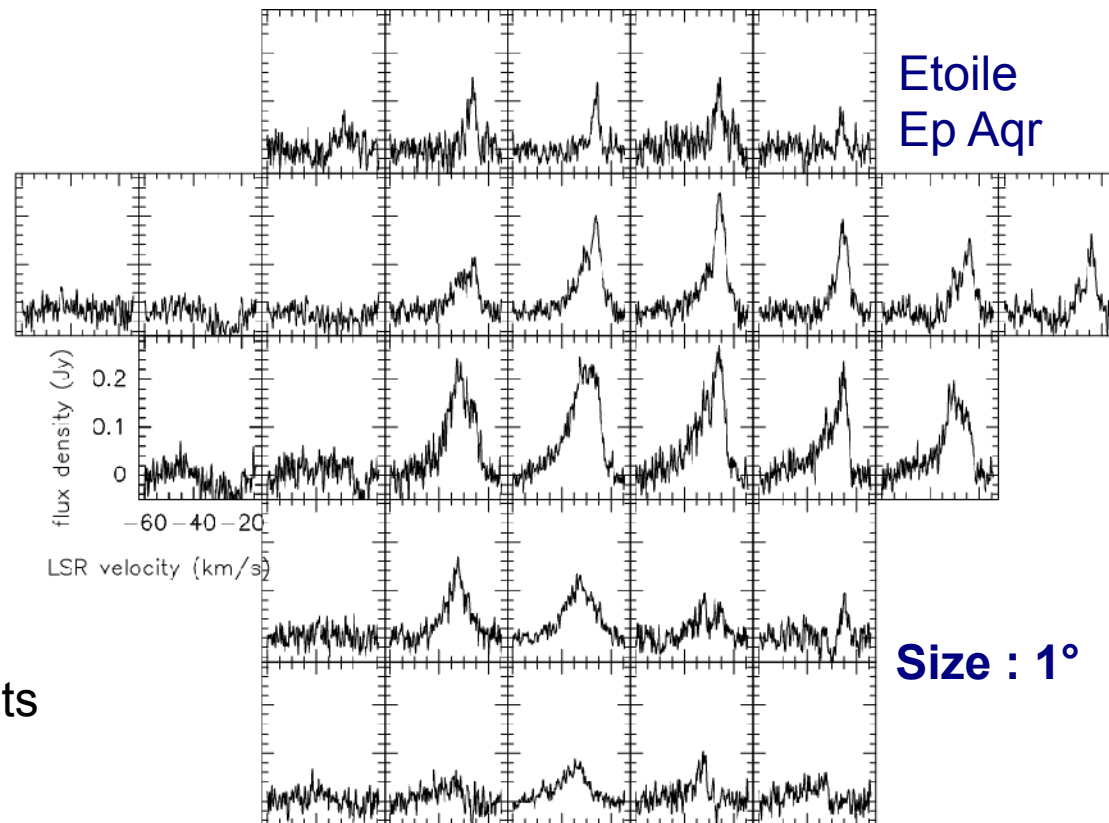

**Needed for a 5 beam FPA** (J.Pezzani 2014) 102 pixels of 15cmx60cm x 2 pol.

**On-going study** of a checker board antenna - science definition workshop (sept.)

## Science objectives:

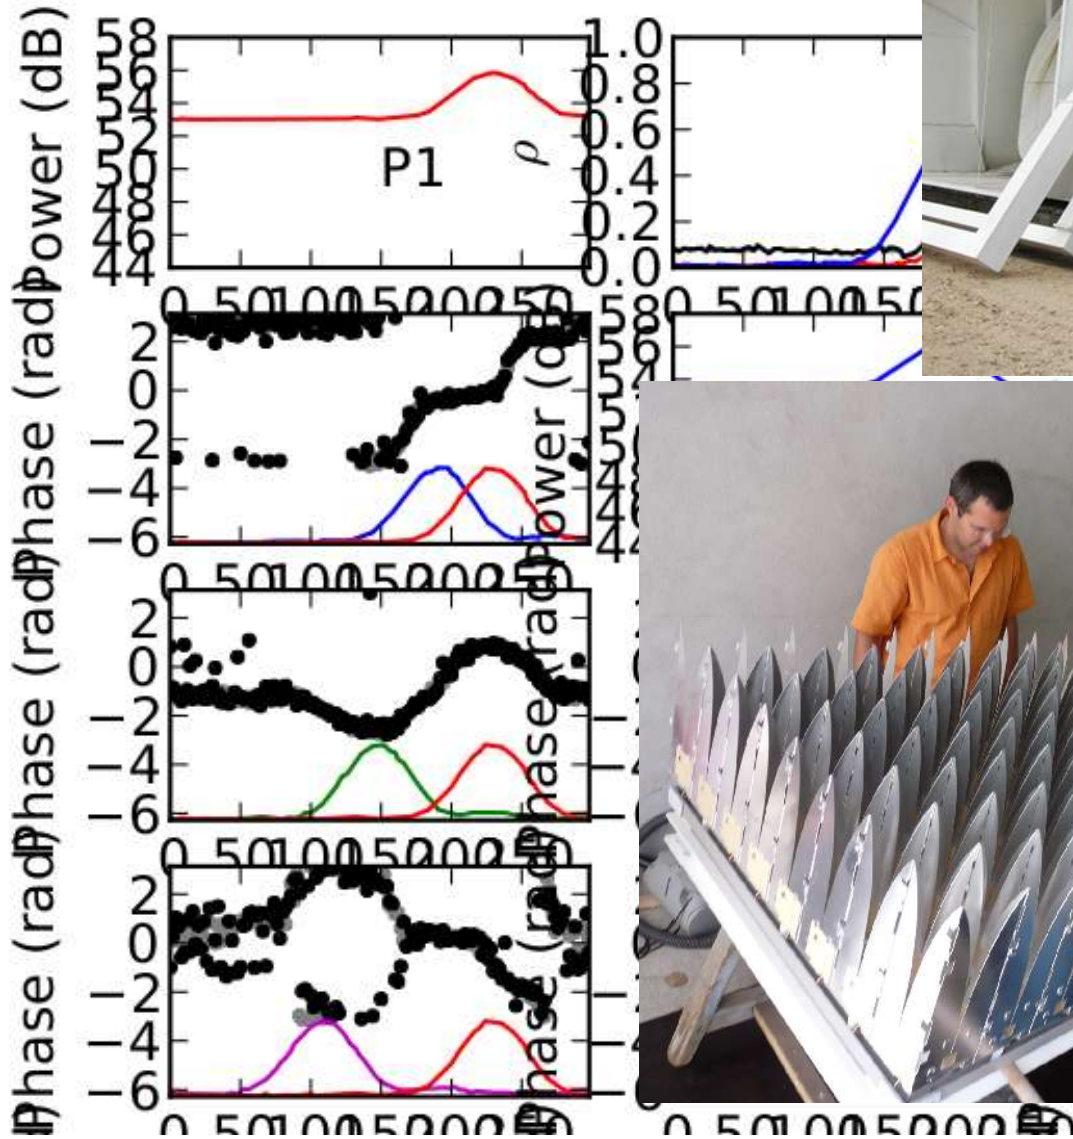

- BAO (need 100 beams)
- search for transients (PSRs?)
- mapping of extended sources - stellar mass loss (up to 30h/map) – see figure, interaction stellar winds/ISM, bright comets
- complementarity with interferometers

# FAN prototype receiver(2)

**Processing:** waveform acq. on disk  
Post processing off-line (C.Dumez-Viou).

# The PAON2 interferometer

**Why?** Application for PAON4 submitted early 2012. But, needed to get some first interferometric results with the BAORadio acquisition system

**How?** 3m dutch antennas+horns designed at Nançay+quick/simple and '~no cost' pedestal mount.

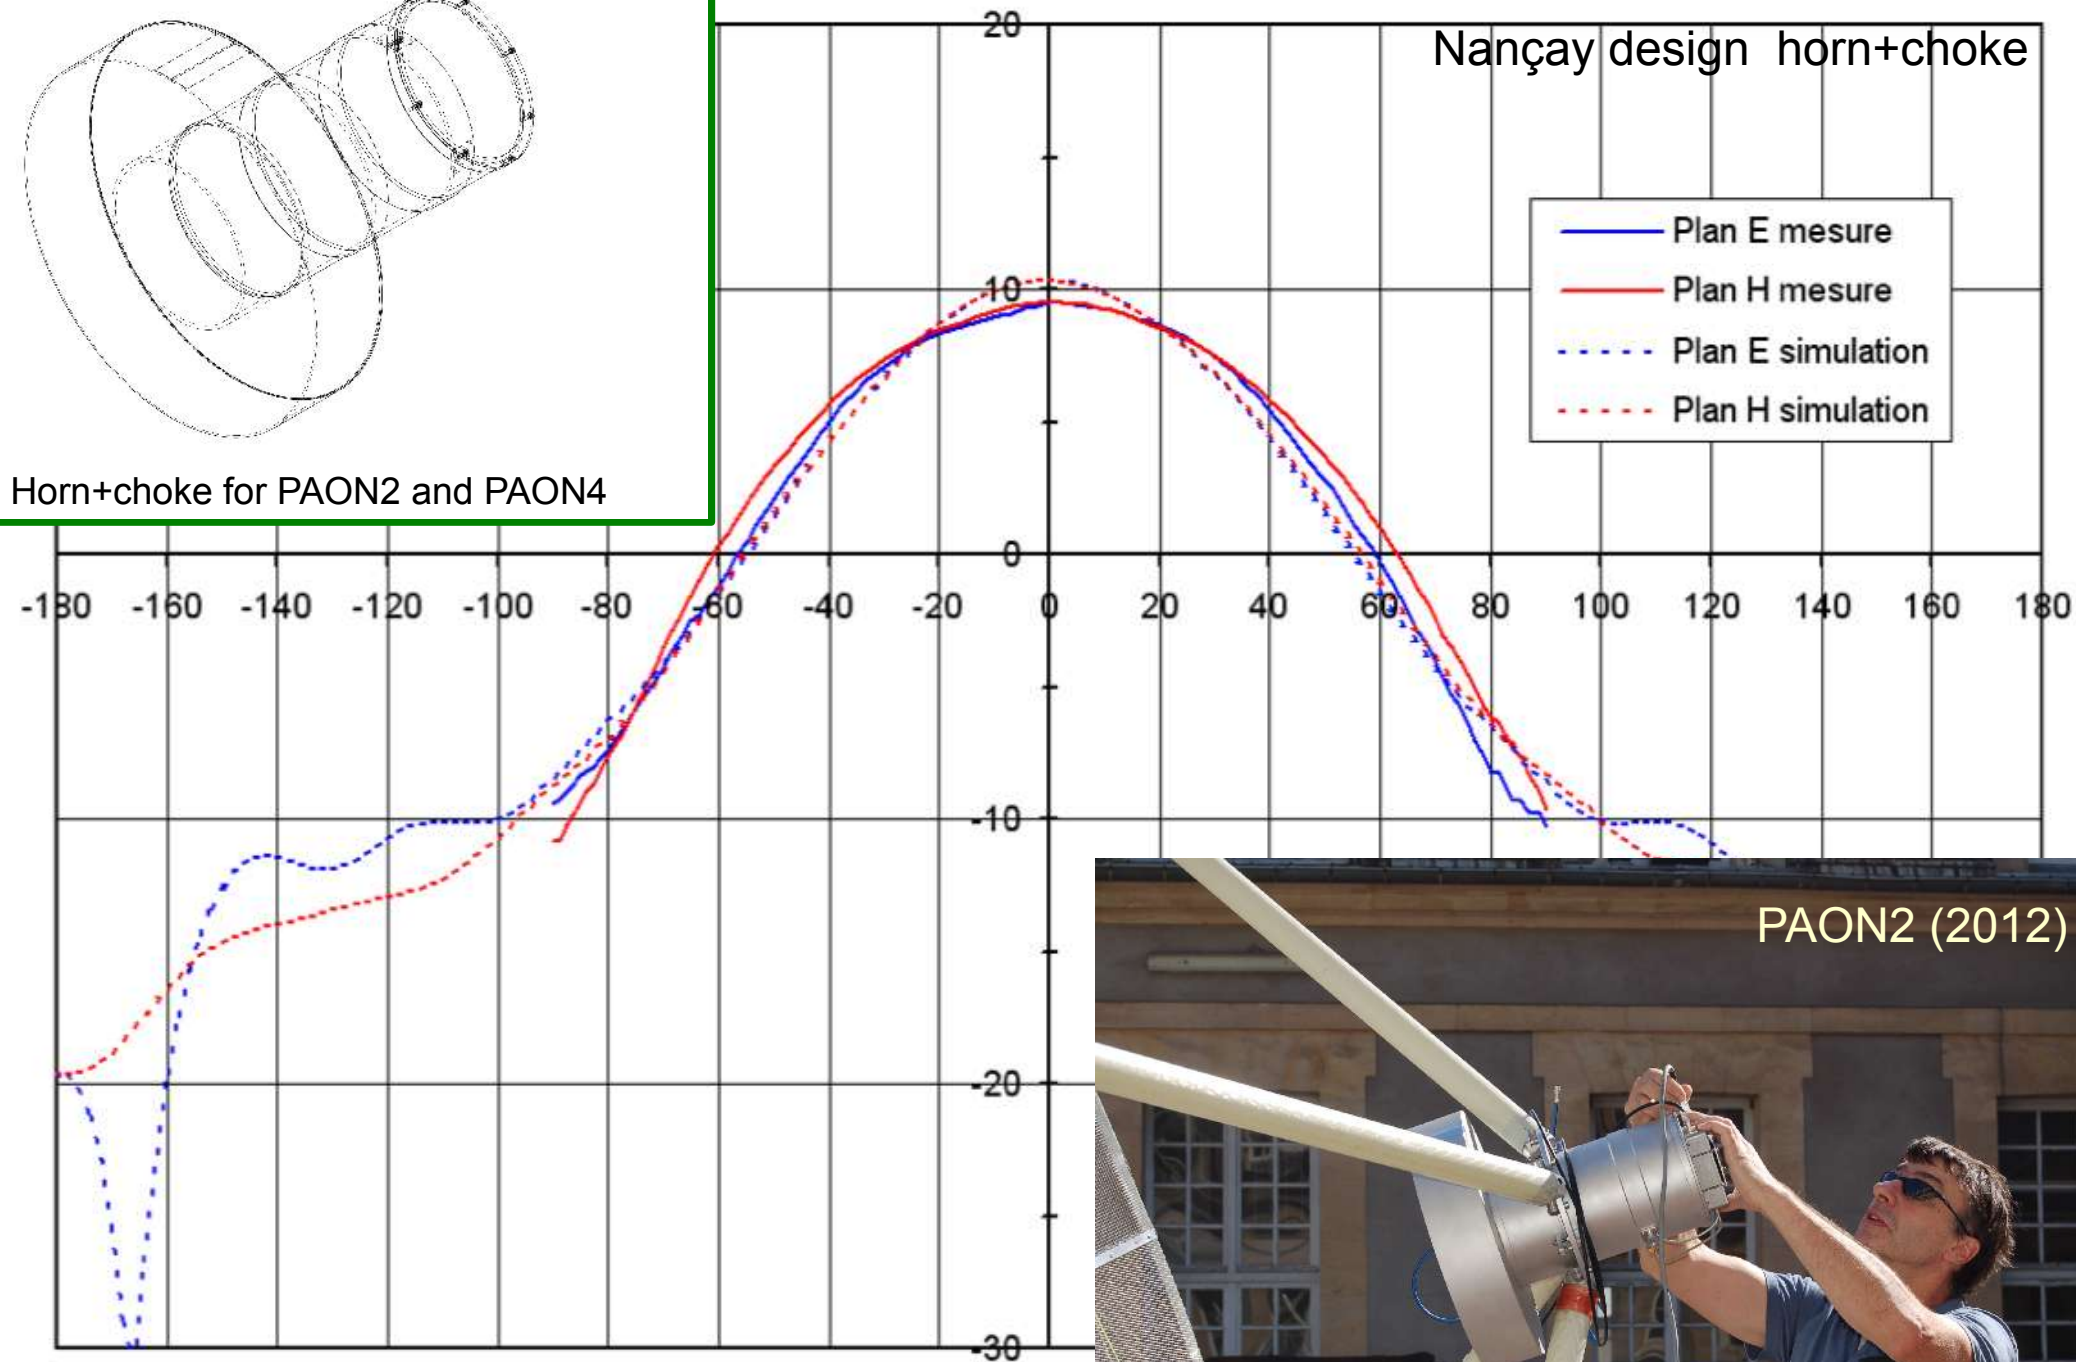

**When?** autumn 2012- winter 2013. Now back in Meudon to upgrade the 'Master' level training interferometer (replace TV Yagi antennas with the parabolas+ new dipoles for ~860MHz Solar obs.).

Horn+choke for PAON2 and PAON4

Nançay design horn+choke

PAON2 (2012)

Horn modeling/measurement: J.Pezzani. Mechanical design: F.Rigaud. Construction: J.B.Vimon+ F.Rigaud (Obs. Paris). LNAs P.Abbon (CEA).

**PAON-2**  
Installed at  
Nançay  
September 2012

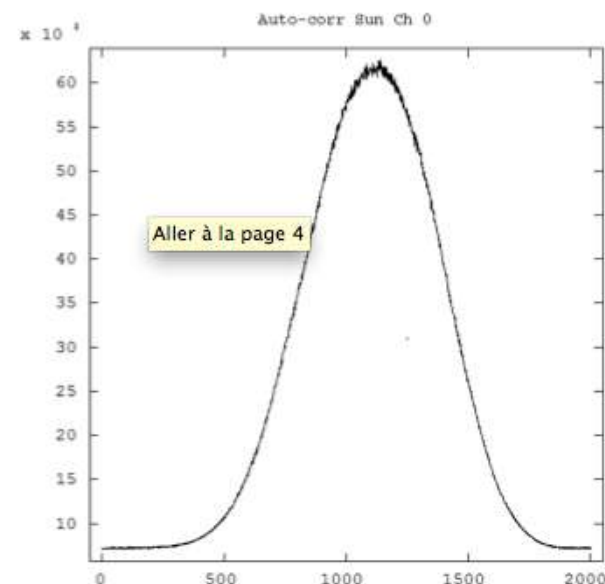

**Sun transit (oct. 2012) : estimation of  $T_{\text{sys}}$ : 140-190 K**  
(depending on channel used, and the determination method).  
Confirmed with Cyg A interferogram.

**PAON-2**

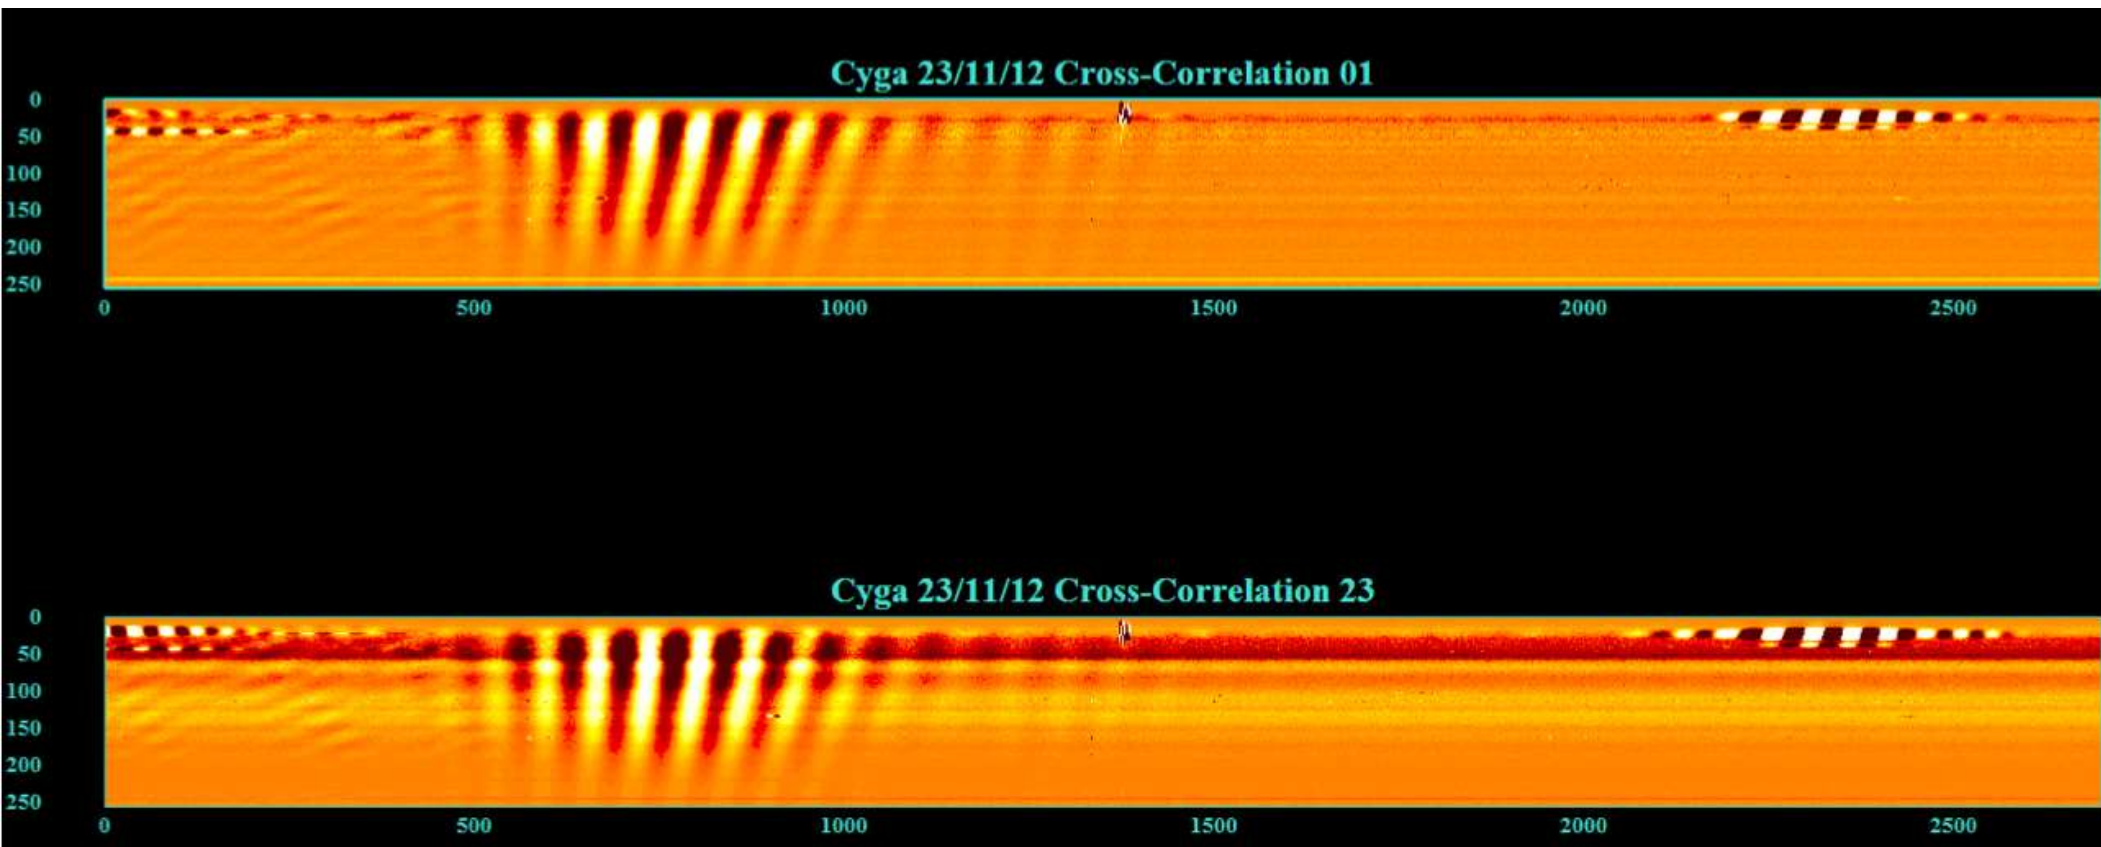

Installed at  
Nançay

September 2012

**Figure 1 Auto-correlation channel 0 during the Sun transit.**

**Figure 4: Cross-correlations between aligned polarizations during the observation of Cyga transit. The run in total represents 4h (x-axis). The 250MHz total band is along the y-axis of each image starting on top-left corner at 1250MHz. The main Cyga fringes are localized roughly in the bin range [500, 1000] of the image while we see also human induced signals before and after the transit concentrated around  $1275 \pm 10$  MHz (ie. the fringes spacing do correspond to Sky rotation).**

# The PAON4 interferometer

**Why?** demonstrator - test and improve the electronics + acq. and map making, provide broad band interferometric data at low  $z$ . Preparation of Tianlai with parabolas.

**How?** resistant and cheap antenna+mount (less than 50.000 € [total] + x months assembly: including 2 months for the mesh). 10 years durability (teaching in the future)

**When?** funding proposals accepted in 2012. Design updated early 2013 to reduce production costs, Construction finished in June 2014. Tests → end of 2014.

# Mechanical study and construction of the PAON4 antennas (BAORadio IN2P3-LAL, CEA-IRFU, Obs. de Paris)

# PAON4 - mechanical study

Résistance aux sollicitations dynamiques :

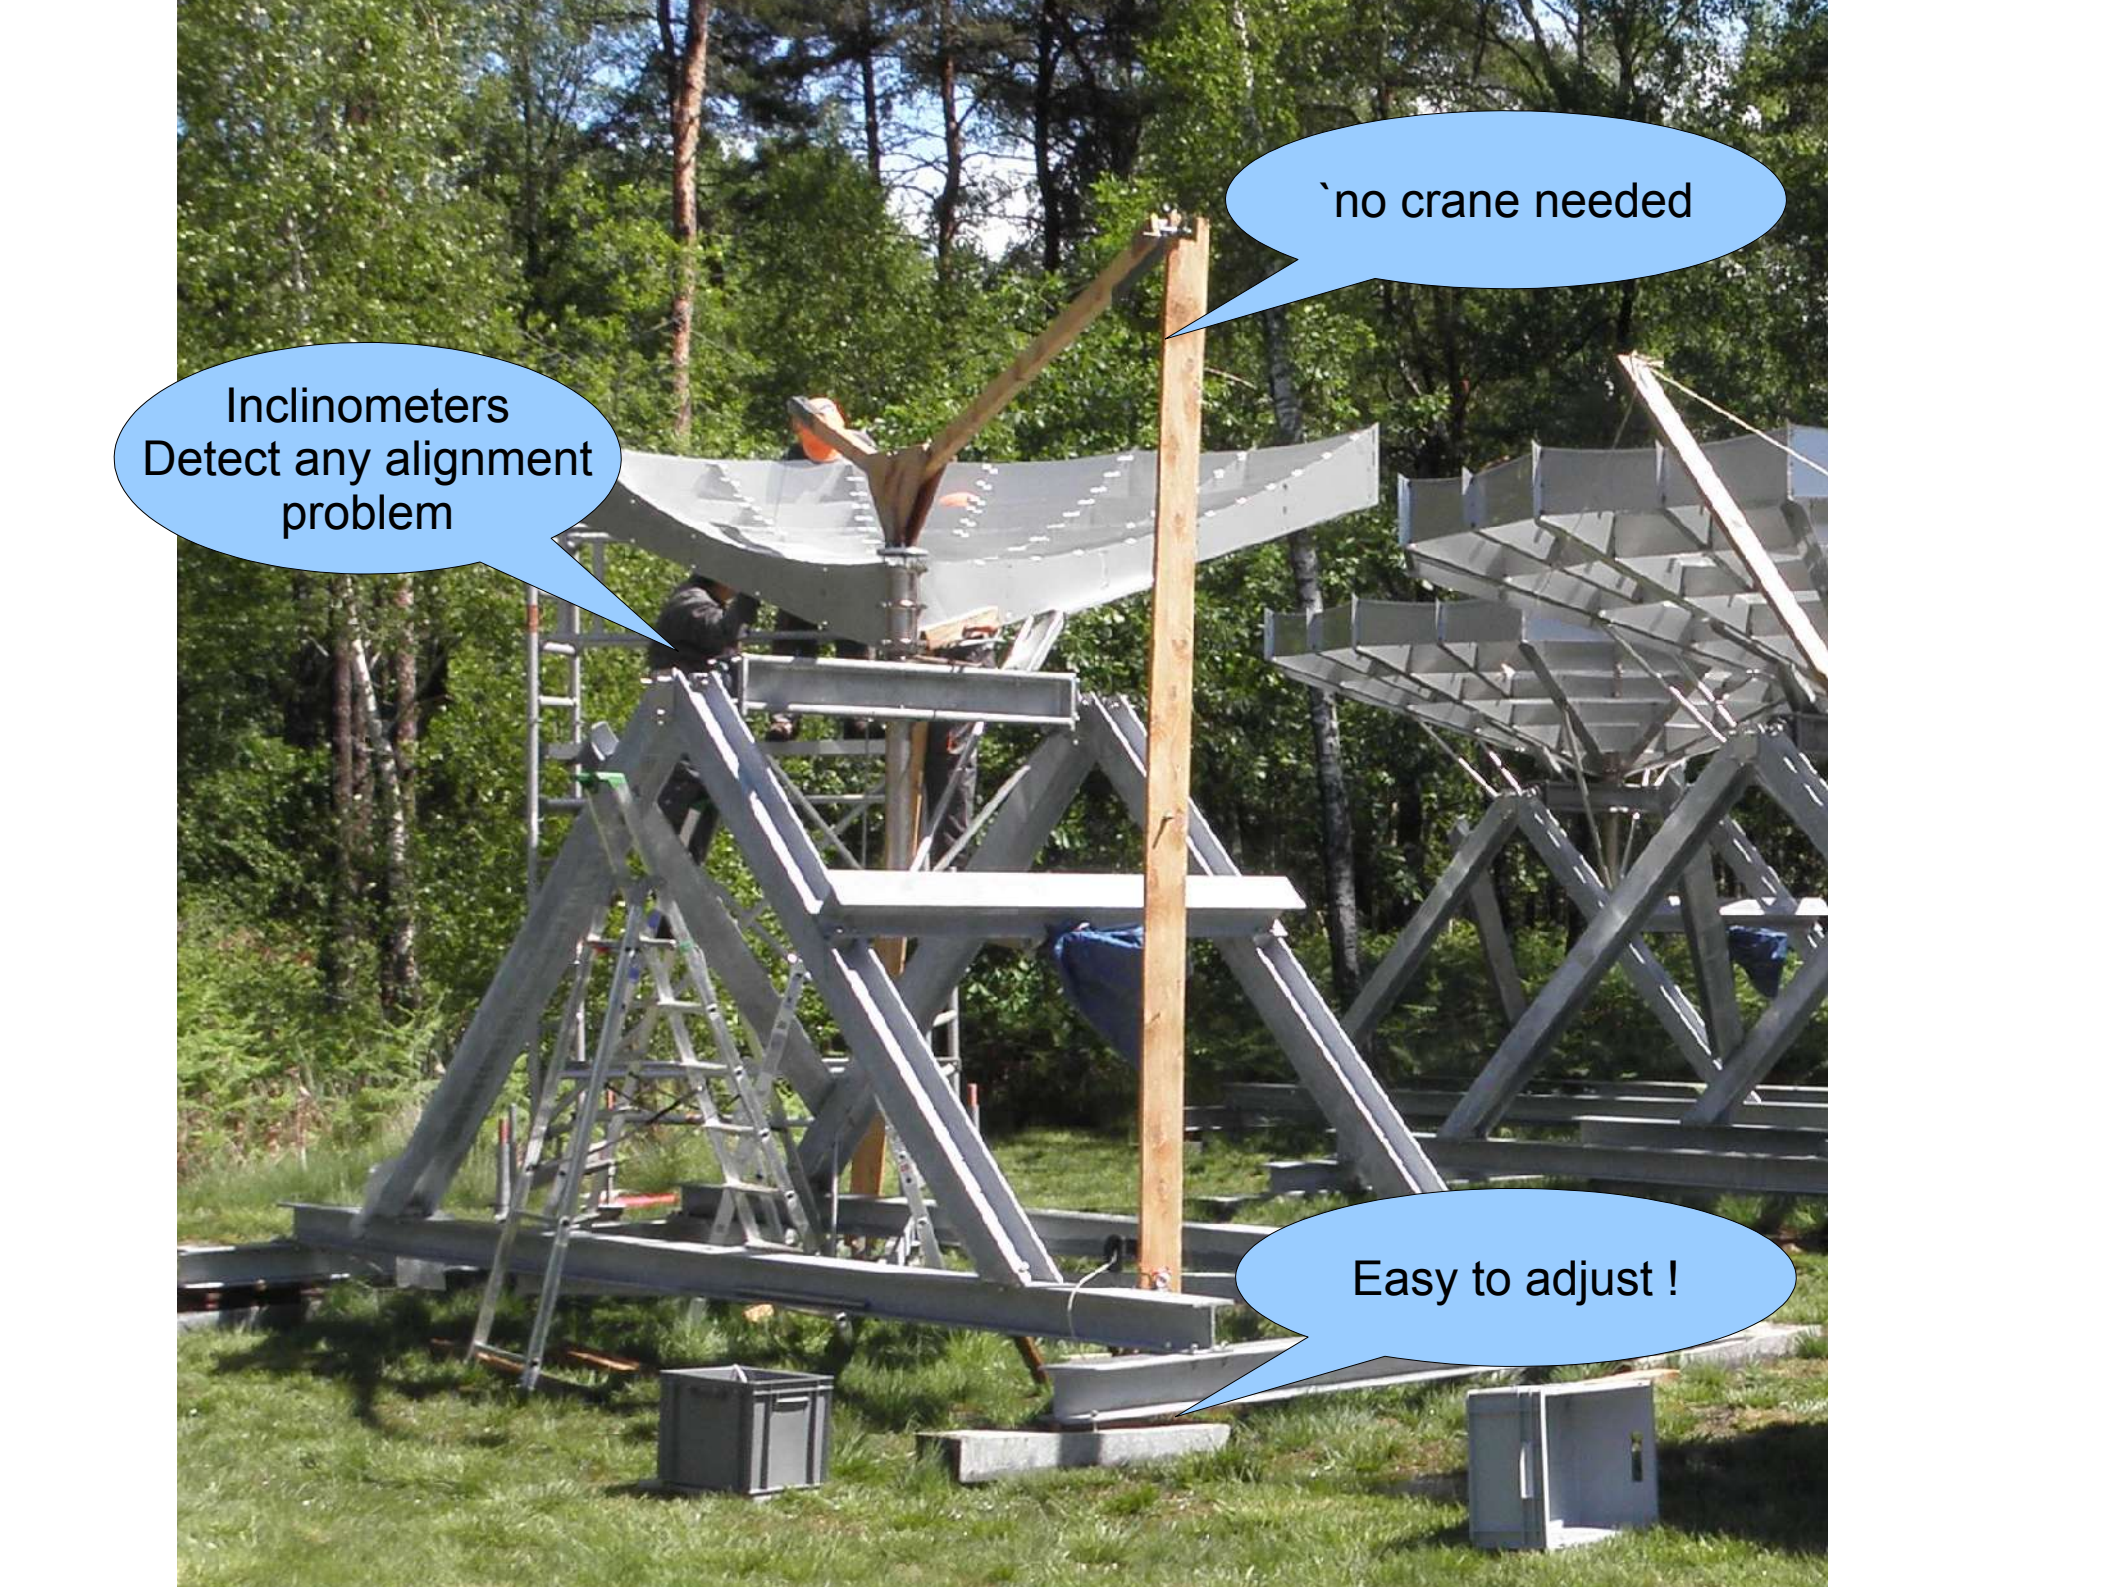

Freq. = 20.336, Eigenvectors, Translational, Magnitude, (NON-LAYERED)

: Freq. = 20.336, Eigenvectors, Translational.

Calcul par éléments finis,  
1ère fréquence propre sollicitée : 20 Hz.

Inclinometers  
Detect any alignment  
problem

`no crane needed

Easy to adjust !

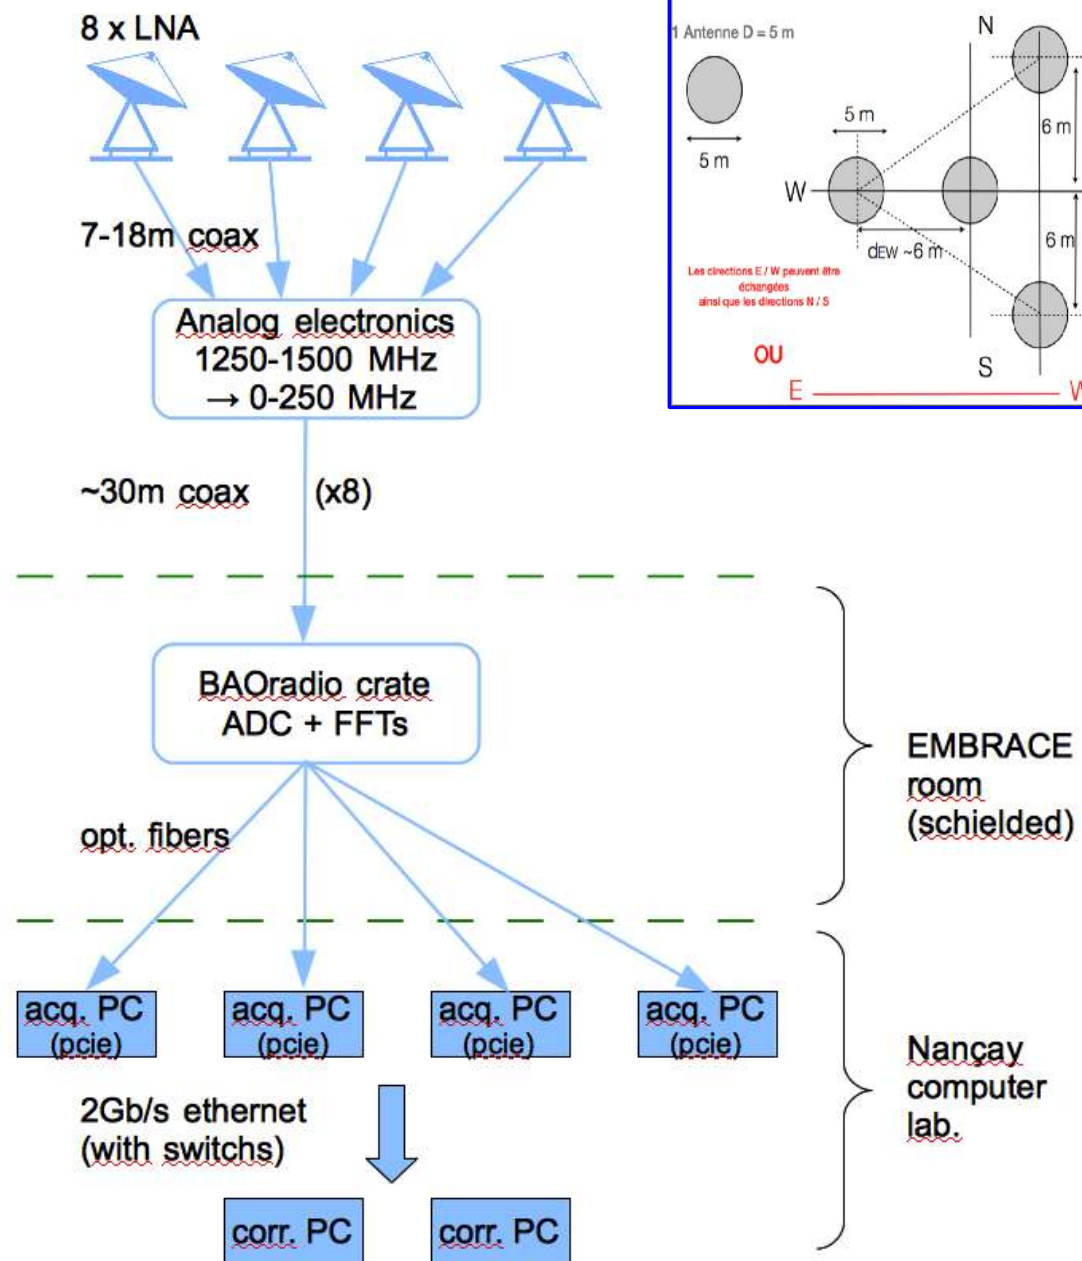

**PAON-4**  
Installed at  
Nançay  
May 2014

# PAON4 - identity card

- 4 x **5m** parabolic dishes - mesh reflector (1cm mesh) - horn+choke
- optimized config. (JZ&RA)
- meridian mounts, 38°S to 15° N (**DEC 10° to 63°**)
- covered band **1250-1500 MHz**  
useful band **~150-200 MHz**
- 4 x **2 polarizations**
- throughput: 8 channels @ 500 MS/s (**4 GB/s** if 100% duty cycle)

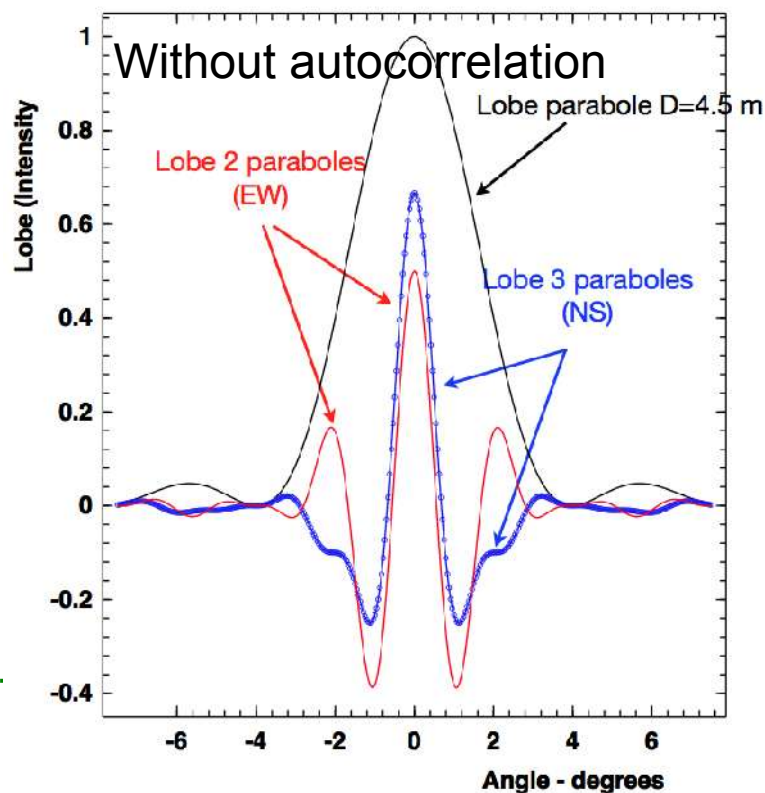

# PAON4 - Array configuration (1)

- Antennas at the requested positions (controlled in May 2014)
- Array optimized (J.Zhang, R.Ansari -see Jiao's talk).

lobe2D - 4 paraboles

$\pm 6$  degrees

R.Ansari 2012

Angle - degrees

# PAON4 - Array configuration (2)

# PAON4 - test, improvements

- Interferometric tests with EMBRACE ? with the NRT
- **NEBULA project** (LAL-Nançay): new generation ADC + fiber outputs/new data format boards to be installed in each antenna (support from CNRS/INSU, 2014)
- UNIBOARD (RadioNET) processing boards ? (100% on sky)

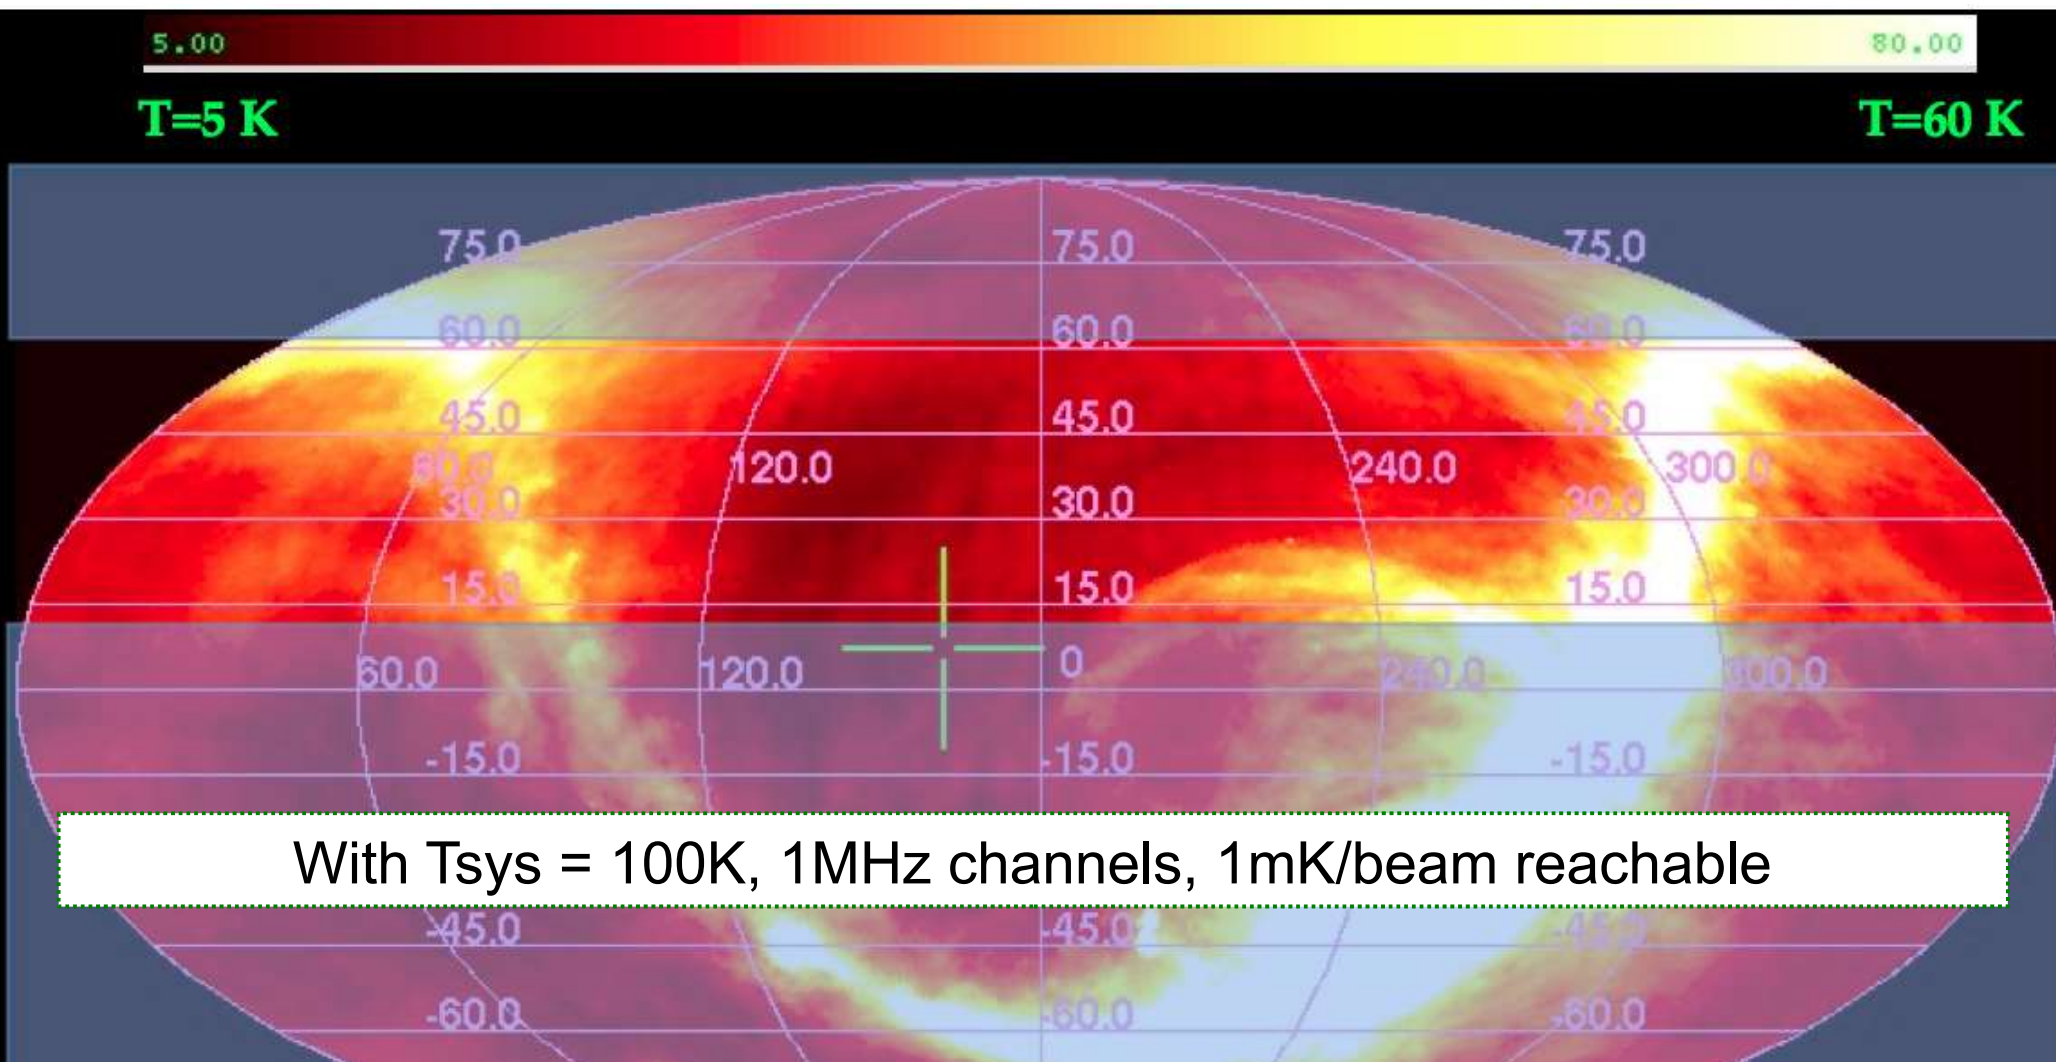

**Figure 1** The auto-correlations [1250,1500]MHz averaged over ~7000sec (122kHz) during the noise run of the 21<sup>st</sup> Nov. 12. The color code stands for blue (Ch0), red (Ch1), cyan (Ch2), orange (Ch3). The histograms are normalized as the sum over the 2048 bins is set to unity. No filtering has been used.

# PAON4 - Science test

20° strip: 10 x 2° scans x 10 (100 days of observation)

- need to improve the duty cycle

Other possible test observations: extended galaxies, interferometric obs.

Thank you !

additional slides

# Electronique: BdT @ LAL

Synthé Agilent: 1250MHz

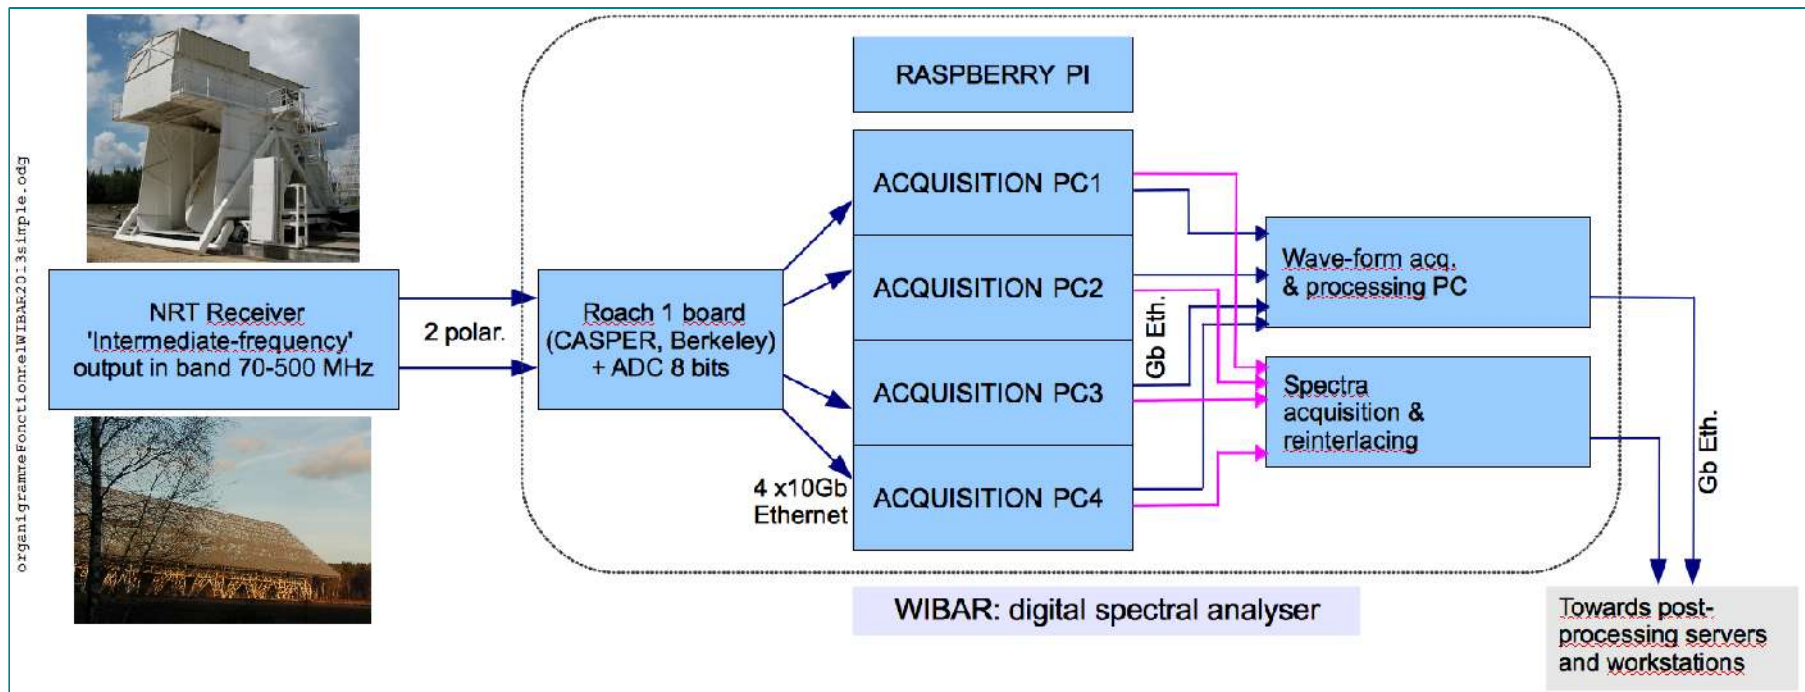

OL/mixer+ADC

## WIBAR

- connected to the receiver: two linear or circular polarisation signal
- 70 to 500 MHz band
- Roach1 board (CASPER, Berkeley): 2x8-bits ADC and dedicated firmware (Nançay radio astronomy station)
- incrementally tagged data sent to PC1 and 2 for first pol. PC3 and PC4 for the second polarization signal.
- acquisition PCs process only half of the data flow (960 MS/s)
- spectra calculated in real time by the GPUs or raw data waveforms are stored on internal RAID arrays.
- Data are transferred immediately after acquisition to two off-line computers and, later, to the users' servers.

Galaxy HIPAJ0626+2439 with  
WIBAR and with the standard  
NRT correlator
