AI and the meaning crisis

vendredi 29 avril 2022 11:30 (30 minutes)

How to bring value into AI: Valuelessness is an inherent and proudly upheld feature of the scientific approach. It made it successful for modelling the material world and to keep our biases under control. I will argue that, at the same time, it is one of the main obstacles for developing true AI that can be seamlessly integrated in society. I will shed light on this argument through my personal journey of putting together what I do with who I am, which is the very process we need to understand to make AI truly human-like. I will use the brilliant 4P metacognition framework of John Vervaeke to sketch a roadmap and to situate our work on action-oriented AI for optimizing engineering systems.

Orateur: KEGL, Balazs (Huawei France)

Classification de Session: AI and physics conference
