Higgs Effective Field Theories results in the ATLAS experiment

Alexander Held¹ on behalf of the ATLAS Collaboration

¹ University of Wisconsin–Madison

Higgs Hunting 2022 (Paris) https://indico.ijclab.in2p3.fr/event/7779/ Sep 13, 2022

Introduction

- Effective field theories (EFTs) can capture effects of heavy BSM states as perturbation around the Standard Model
 - different approaches possible: SM ⊂ SMEFT ⊂ HEFT (see <u>arXiv:1706.08945</u> for a review)
- Standard Model Effective Field Theory (SMEFT)

 $\mathbf{\mathcal{L}}_{SMEFT} = \mathcal{L}_{SM} + \sum \frac{c_i}{\Lambda^2} \mathcal{O}_i^{d=6} + \dots^*$

- expand SM with additional $SU(3)_C \times SU(2)_L \times U(1)_Y$ invariant interactions
- expansion parameter Λ interpreted as mass scale of new physics
- different flavor symmetry assumptions possible: e.g. $U(3)^5$, $U(2)_q \times U(2)_u \times U(3)_d \times U(3)_l \times U(3)_e$
- Wilson coefficients (free parameters) c_i are correlated
- Higgs Effective Field Theory (HEFT)
 - non-linearly realized electroweak symmetry with Higgs boson + independent Goldstone bosons
 - more general than SMEFT, no correlations between free parameters

BSM models could leave imprints at accessible energy scales, measured via Wilson coefficients

Overview of recent ATLAS Higgs EFT results

• HEFT

• **Di-Higgs** $b\bar{b}\tau\tau$ + $b\bar{b}\gamma\gamma$ **HEFT interpretation** (March 2022, <u>ATL-PHYS-PUB-2022-019</u>)

SMEFT

- $H \rightarrow \gamma \gamma$ differential cross-section (Feb 2022, JHEP 08 (2022) 027)
- $H \rightarrow \gamma \gamma$ **STXS** with EFT interpretation (July 2022, <u>HIGG-2020-16</u>)

combinations with increasing number of input analyses

- STXS Higgs combination with EFT interpretation (Nov 2021, ATLAS-CONF-2021-053)
- Higgs + EW + precision observables SMEFT global fit (July 2022, ATL-PHYS-PUB-2022-037)

Di-Higgs $b\bar{b}\tau\tau + b\bar{b}\gamma\gamma$ HEFT interpretation

ATL-PHYS-PUB-2022-019

g uuuuuu

g uuuuu

g uuuuuu

g uuuuuu

oduction

SM-like

- HEFT interpretation of di-Higgs^{*} in $b\bar{b}\tau\tau$ and $b\bar{b}\gamma\gamma$ final states + combination
 - $b\bar{b} \tau \tau$: template fit to NN and BDT, $b\bar{b}\gamma\gamma$: unbinned fit to $m_{\gamma\gamma}$ across multiple categories
 - ▶ *m*_{HH} based reweighting of SM HH sample, limits also set on 7 HEFT benchmark models (backup)
 - limits on HEFT Wilson coefficients c_{gghh} and c_{tthh} from $b\bar{b}\tau\tau + b\bar{b}\gamma\gamma$ combination
 - <u>ATLAS-CONF-2021-052</u>: c_{hhh} obs. (exp.) limit : $-1.0 < c_{hhh} < 6.6$ ($-1.2 < c_{hhh} < 7.2$)

more $H \rightarrow \gamma \gamma$ results: <u>Ruggero Turra's talk</u>

$H \rightarrow \gamma \gamma$ differential cross-section

• SMEFT interpretation of $H \rightarrow \gamma \gamma$ differential cross-section measurement

- simultaneous fit to five measured differential distributions: $p_T^{\gamma\gamma}$, N_{jets} , m_{jj} , $\Delta \Phi_{jj}$, p_T^{j1} (covariance matrix via bootstrapping)
- ▶ 8 Wilson coefficients measured (one at a time) in Warsaw basis
 - → c_{HG} , c_{HG} scale ggF, c_{HW} , c_{HB} , c_{HWB} (+ CP-odd versions) affect mostly $H \rightarrow \gamma \gamma$ rate and VBF, VH

JHEP 08 (2022) 027

SMEFT interpretation of 33-bin STXS

measurement

- targeting different production modes and binned in $p_T^H, m_{jj}, N_{jets}, p_T^V$
- fitting STXS bins with Higgs processes parameterized by Wilson coefficients
- ▶ affected by 34 Wilson coefficients in

Warsaw basis

• Left: relative impact per STXS bin of

most relevant SMEFT operators

- SMEFT measurement results (one Wilson coefficient at a time)
 - difference between linear and linear+quadratic parameterization indicate potential impact of higher-order terms
 - especially for parameters sensitive to high p_T^H in ttH / ggF (e.g. c_G) and high p_T^V in VH (e.g. $c_{Ha}^{(1)}$)
 - simultaneous fit of 12 linear combinations of Wilson coefficients also performed (backup)

Higgs combination STXS interpretation

more combination results: Paolo Francavilla's talk

- SMEFT interpretation of statistical combination
 - of many Higgs analyses
 - signal strength per STXS bin parameterized as
 - function of Wilson coefficients

analyses used in EFT interpretation

*: new or updated wrt. previous combination (ATLAS-CONF-2020-053)

Decay channel	Production modes	Reference

results (using linear model)

measured parameters

Global SMEFT fit: Higgs + EW + EWPO

First ATLAS global EFT interpretation

- ATLAS Higgs STXS measurement (ATLAS-CONF-2021-053)
- ATLAS differential cross-section measurements of weak boson production (ATL-PHYS-PUB-2021-022)
 - unfolded fiducial cross-sections: $WW(p_T^{l1})$, $WZ(m_T^{WZ})$, $4\ell(m_{Z2})$, VBF $Z(\Delta\Phi_{jj})$
- LEP + SLC electroweak precision observables (EWPO) (Phys. Rept. 427 (2006) 257), 8 observables included

LEP/SLC EWPO: $\Gamma_{Z}, \sigma_{had}^{0}, R_{\ell}^{0}, A_{FB}^{0,l}$ $R_{b}^{0}, R_{c}^{0}, A_{FB}^{0,b}, A_{FB}^{0,c}$ with $\sigma_{had}^{0} = \frac{12\pi}{m_{Z}^{2}} \frac{\Gamma_{ee}\Gamma_{had}}{\Gamma_{Z}^{2}}$ $R_{\ell}^{0} = \frac{\Gamma_{had}}{\Gamma_{\ell\ell}}, R_{q}^{0} = \frac{\Gamma_{qq}}{\Gamma_{had}}$ $A_{FB} = \frac{N_{F} - N_{B}}{N_{T} + N_{P}}$

Measurement setup

- overlap removed between ATLAS Higgs and EW inputs
- assuming flavor symmetry between first two quark generations and all three lepton generations
- PCA to identify 28 linear combinations of c_i
- combination also with only ATLAS inputs (backup)

Summary

• Growing number of Higgs EFT interpretations performed by ATLAS

- examples shown in both HEFT and SMEFT frameworks
- results consistent with the Standard Model observed so far

• Combinations of measurements allow probing increasingly large number of operators simultaneously

• rotations performed from Warsaw basis to linear combinations of operators with sensitivity

• First global ATLAS EFT interpretation of ATLAS Higgs + EW results + precision observables

• includes simultaneous measurement of 28 linear combinations of Wilson coefficients

Backup
