Sensing dynamical phase transitions

mardi 13 juin 2023 15:50 (20 minutes)

We will consider a parallel quantum dot as an example of an open quantum system that can feature a strong parity symmetry. For the dot, due to the presence of interactions, this symmetry results in the bistability characterised by distinct particle currents, while its explicit breaking leads to metastability. We will discuss when parameters of the dynamics can be estimated by continuously measuring the particle currents, despite their fluctuations diverging in the proximity to such a dynamical phase transition.
