Sos Enattos, the ideal site

Low seismic noise, limited presence of groundwater, rock masses that are ideal for safely building the underground spaces for the ET laboratory, large rural areas with very low population density and, therefore, limited anthropogenic and industrial

All this makes the area around Sos Enattos, between the municipalities of Bitti, Lula and Onani, the 'silent' environment that the ET needs to operate.

gravitational wave detector

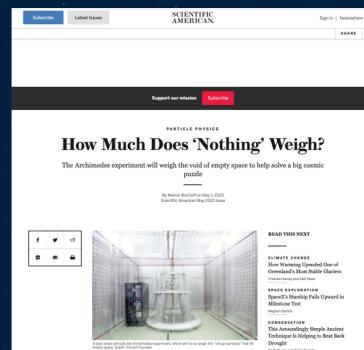

Italy is bidding to build the Einstein Telescope in the old mine of Sos Enattos. Success will depend on securing funding and preserving the site's tranquility.

does something to you when you drive in here for the first time,"

Enrico Calloni says as our car bumps down into the tunnel of a

mine on the Italian island of Sardinia. After the intense heat aboveground, the contrast is stark. Within seconds, damp, cool air enters

darkness to a denth of 110 meters underground, isn't for everyone. But it's

the car as it makes its way into the depths. "I hope you're not claustrophobic." This narrow tunnel, which leads us in almost complete

the ideal site for the project we are about to see-the Archimede

experiment, named after a phenomenon first described by the ancien Greek scientist, which aims to weigh "nothing."
